Uh a Sidewinder 400 and a Palomar 225. Oh yeah I hear people using them on ham band all the
time, NOT!! But, I like people that run FM rigs on The CB freqs. Cause normally they think
they
can go hide in the FM mode and talk shit about people. They think they are funny when they
do
this cause they think that people without FM on their radios can't here them. Well guess
again,
normally I just Slide up about 3 KC's and start recording. Hear them clears as day on my
148.

Um look closer, they are running off the battery. The grounds need to be kept as short as possible and always run the same gauge ground as power.

I have a plus 3, and have used a number of others over the years,usually
just for SSB,a lot of what sounds the best is the way it enhances your voice
characteristic's,the plus 3's tend to do the best for me, on the other hand
even though they are excellent mic's,the d-104's tend to give my voice a bit
of a higher pitch, never had any problems sidebanding with a plus2,but
always turn it down to about 4, or a bit less, 73's

Have you ever thought of running a LONG piece of coax to your vehicle, and talk off of your mobile antenna?? Sure it sounds corny, and it would be kinda inconvienient...But you sound like you are a person in a desperate situation.
I did this for a while....., and it works a HELL of a lot better than ANY indoor antenna, or any of those cheapo wire antennas.
I used the Workman Launchpad (3 --5" magnets), and a "55" open coil antenna, on the roof of my pickup (I also use this for my mobile antenna), parked in my backyard....with an RCI-2950 radio, and a Texas Star DX-667V,
.....Hooked to a 100a Gel-cell battery (it doesn't emit any fumes), and a Schumacher 125a battery charger..... Worked great!!!!

Let me know how it goes.....
I can get you a launchpad for $40.00 + shipping and you can get a "55" from www.bellscb.com .
I also suggest the "Monkey Made", works real well www.antennawarehouse.com . You can E-Mail me at StateOfTheArtCB@webtv.net

I just finished the new setup for my Suburban today. I designed my own rack and had it welded together. The setup is fairly simple but functional. It is totally independent of the truck's factory systems so I won't be stranded due to any mishaps. Adjusting, removing or replacing the belts is a one man job and no pry bars are required. All of the connections to the alternators are visible and accessible for safety. Because of where I live, I must keep the emissions system intact and have also retained the air conditioning. Due to the weight of these things I suggest you go overboard on your hardware by using good quality bolts that are big enough for the job. Last but not least is shimming. Take your time here. The pulleys absolutely have to be lined-up. Use straight edges or squares even a second opinion. When you start your engine look for black fragments or dust (rubber from belts) as this will be a clue that something is not in line. So far I've got about 80 miles on it and everything looks ok. I've checked it all day. I'll take pictures of it before the road stuff gets all over it and send them to you.

[..]

If what your are trying to accomplish is to activate a recorder when the squelch opens you may consider an equivalent method to do this using a computer, software and a sound card.

Check out http://www.davee.com/scanrec.html

This program can be set to activate at any given signal level (regardless of whether the squelch is open or not) and when that level is exceeded it will start recording.

Naturally, this solution is only semi-portable assuming that you have a hand held scanner and note book computer.... But it is fine for stationary or semi-stationary applications.

2000. 2 meter mobile antenna question

Newsgroup: rec.radio.cb
Date: 2000-02-23 00:00:00 UTC
From: dongilbert@my-deja.com
Message-ID: <890n36otg1@nnrp1.deja.com>
Source record: 24583

I just received my tech license and am looking at 2 meter radios and antennas. I want a good performing antenna that will not look unsightly on my truck. (89 F-150 ford longbed). I was looking through a catalog and found a diamond nr2c which had 4.1 gain. I was thinking about mounting this behind my rear window in the center of the bed rail. Someone said that I might have trouble with wind loading since this antenna is almost five feet. What does this mean?

I am not crazy about mounting anything on my roof or hood or any other place that might seem unsightly. (To me anyway.) Someone also mentioned to me that by mounting an antenna in the cente rof the bed rail behind the window I might be creating a high swr which would burn up my radio. Is this true? How do i detemrine if a location will burn up my radio or not?

Please forgive all the questions, i am new to this and trying to learn all I can.

I bought a Teaberry Stalker I the other day, and it only cost $40 and after
I hooked it up and checked it out I decided that it was the cleanest
sounding
radio I have heard in awhile. I also have TRC-448 that works well also--and
it also cost around $40. these are all decent sideband rigs with no bells,
whistles,
or other gimcracks--but they work fine. My favorite though is a Lafayette
HB-740,
it has good ears and yet still runs quiet even though I run it off the cigar
lighter
socket--I just wish it were sideband, but I only paid $20 for it so I can't
complain
too much.

I used to own a lot of Uniden radios, and at the time I also owned a Cobra 146--
and when I took a look at the schematic and opened the cover--Lo! it was another Uniden! However, I understand that Cobras are NOT made by Uniden anymore. Mores the pity! My favorite radios were either made by Teaberry or Uniden, and then also Lafayette was good too--very quiet in the mobile.

But what is up with Cobra? Make CHEAP, Sell HIGH? They will Rue the day!

+You may wish to add a cap to ground on the rectified audio signal to integrate over several cycles.
+And perhaps a high resistor in parallel with the cap to discharge it when no signal is present.

> feed the other comparator input with a pot (to vary dc bias -- change your
>trigger threshold)
> feed the output of the comparator to a transistor (to act as a switch)
>

>
+ Another point. If your audio level is not high enough to get through the rectifier, you might
+ consider an active rectifier using a diode in the feedback loop of an opamp circuit.

-----> Equipment For Sale <------

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition
with copy of manual $250.00 (Pending Sale)

Yaesu XF-32A SSB filter for FT101 series, $40.00

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $120.00

Commercial VHF Handhelds:
Motorola Radius P50
Kenwood TK240 with drop in charger
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $150.00 Reduced to$130.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00

Browning Mark III, AM transmitter and 2 AM/SSB receivers, working.
With 2 non-working parts AM/SSB transmitters and 1 non working
AM/SSB receiver. Complete Package $400.00

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required $150.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics
Mere, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

If your friend will let you try it in your mobile, then that is what I would do. If it works great for you
wherever you will be using it--then if you like it--buy it. A lot of people do not like the Sound Tracker
radios, and I have not tried any, but then many people have disagreed with me as to which radio
is the best. HOWEVER, the ones I like are all old ones and don't have any super mods for them. I
still like them and since I got back into CB, I have bought many of the radios I used to have for
a song here and there. I knew way back when that my choices were good because everybody wanted to buy them from me. They heard how they sounded on transmit, and then they listened to them at my home or in my car and then they wanted to buy. I usually sold so I could try something new, or better (in my mind_not always!) and if they were happy so was I. Most of the time, I wanted to get a radio that was loud without splatter, and had good ears--yet was
free of excessive engine noise or local interference--it was my holy grail, and I never did find a
SSB unit that matched all of those wants, but I did find a Lafayette for AM that worked like
a charm on all counts--except it was not super loud on Xmit, it sounded good--but not LOUD. I also found a RS TRC-456 that was only deficit in the engine noise department (not too bad though)
and I still use both. In the end, listen to everyone's advice and then do what the heck makes you
happy.

A friend of mine has a 29Ltd.ST he wants to sell me but I keep hearing
bad things about this rig. I put it on my Dosy an it had a dead key of
5 1/2 and swings to 20, it TX's at a steady 14 w/ a power mic. People
I've talked to on this rig allsay it sounds great, loud and clear, but
thats on my A99. The data plate on the back says date of mfg. 1997, is
the older model better than the newer ones ? This rig does not have
weather on it , would that make a difference ? Any info would great,
thank you Joe

It's good t be the King

Just started her live broadcast for Wednesday Feb 23. She's going off the deep-end again. She actually says this, "I have never made an anti gay commentary." Says she has only made, "anti gay agenda" commentaries.

Can someone out there help me? Isn't making statements against a "gay agenda" akin to making statements agains gays? Or, is she playing the Clinton word definition game here?

Since I'll be out for the next few day's I'd appreciate it if someone can log important time frames for bizare statements she makes. Or else, I'll go nuts next Tuesday listening to four or five days worth of shows.

Very disapointed with handheld CBs in general,poor reciever,poor transmiter,even a 1/4 wave antenna is over 8' long at 27MHZ so how good could the little whips be? My favorites are the Cherokees,at least they have some neat features.

I recomend a hood-lip mount but the bed rail shouldn't hurt your SWR
too much @ 146MHZ and won't hurt your radio at all,2 meter radios are
protected from such things as high SWR by desighn,we're not talkin CB
anymore.A dual band whip would be shorter and the hood mount looks like
a standard stereo antenna if the right antenna is used.

Tim:

Lighter sockets in my Kenworth are 10 amps MAX.. If you try to draw any more through them, you'll burn up the wiring to the socket. Trust me, I know this from experience in my KW T-600. The best plan (for the KW's) that I've found is to run the power wires to the jump-start posts on the driver's side frame. This works on the KW's, anyway. And every time you run through the truck wash, they wash the rails, knocking the corrosion off the connections for you!.

Works for me, anyway.

I recomend the Yaesu FT2600 at about $209.I live in a high-RF area and
many radios won't even work here(the ICOM 2100H is one)people try thier
new rigs here and they know that if they work here they will be much
quieter around town(like they should be,this ain't CB).From best to
worse here is what I found about 2 meter mobiles:
Yaesu FT 2500 (maybe a few left)
Yaesu FT 2600
Icom IC 2100H (a far cry from the above)
Icom IC 2000
Icom IC 281H
Radio shack HTX 242
Radio shack HTX212

Well, why not do what I do at home?

Go out and get yourself a pair of 5 foot Wilson Silver Load antennas, and make yourself a dipole. I run one on the truck and one at the house, and I've got ears like you wouldn't believe... The gain from the antenna helps on the get-out, too.

a 10 1/2 foot 5/8 (1 1/4 total wave) dipole will have less wind drag than a beam or most other "taller" antennas, and the gain might just be worth the effort.

Hope this helps.

2061. Homemade antenna...???

Newsgroup: rec.radio.cb
Date: 2000-02-23 00:00:00 UTC
From: Chris <chris@moonco.com>
Message-ID: <38B4510B.39AAC02B@moonco.com>
Source record: 24680

I live in a residential neighborhood that will not allow huge antennas outside. Does anyone know of a antenna that can be made and used for temporary use? I have experimented with magnet mounts, but i can only get the SWR's lower when the antenna is on the ground. Is there such a thing as a no ground antenna... or can I use one of my magnet mounts with a couple of modifications, like some kind of ground? I know this sounds stupid, but untill I can solve the neighborhood problem, it is the only way I can go. Throw any suggestions at me and I will be grateful.

P.S. - No, I can't put the antenna on the refrigerator, it's too tall.

Thanks again,

Chris

1/4 wave verticals mounted above ground need 3 or 4 resonant(1/4 wave)
radials.

Wholesale new is about $575 (I don't think they're worth it) so work
down from there.

Firestik makes a nice indoor antenna you sit in your attic, which you can tune to your hearts desire. Hope this helps.

I have no word on the 4900+ as yet. However the Magnum 257 is here.
Same thing, plus variable output power. Also a manufacturer that
is there for problems, unlike the SuperStar operation.

Operator:

Let's cut through the radio-kiddie BS and try to get you some real answers.

If you're talking about the "hum" you hear on AM that goes UP in channel, or the "whistle" that rises in pitch on LSB or lowers in pitch on USB, I've been hearing this for years. I've been told it is due to solar flares, and is usually a harbinger of the skip cycle. I've noticed it more often when the skip is rolling then when it isn't.

It's not really "interference" in that it's not caused by anything manmade.

Hope this helps.

2080. Re: The old or new 148 GTL

Newsgroup: rec.radio.cb
Date: 2000-02-23 00:00:00 UTC
From: "Christopher G. Petty" <sideband@cac.net>
Message-ID: <38B4A446.EFC3A4A5@cac.net>
Source record: 24699

The ST version of the Cobra 148 has some serious deficiencies over the older model 148. The receive is weaker, and SoundTracker almost never works right from the factory. I haven't been able to get the same power or modulation out of the ST. The board itself is thinner, which means it's less rugged, and may crack in the mobile, like the old 2950/70's did. If you like having your radio in the shop monthly for repairs, pick an ST..

If you can find an old model Cobra 148 GTL, or an original Grant XL (the two radios are essentially the same, and accept the same mods), you'll be much happier with it.

>Can I just get pieces of wirre to act like ground planes?

Exactly. Use at least one wire around nine feet long that
completes the antenna. Run it straight down if possible.
Otherwise run three horizontal nine foot radials that will
also complete the antenna.

An alternative would be a coaxial antenna. Use whatever
length of coax you need to reach the antenna site. With
this coax expose the last nine feet of the inner conductor.
With this same piece of coax fold the last nine feet of outer
braid onto the second to last nine foot section of your coax.

I doubt very much that GM was this deliberate in its designs to
put your friends out of business. I'd be more inclined to think it
was a strategic move for GM to facilitate a better bottom line by
consolidating their repair facilities. I doubt very much that GM
"had it in" for your friends.
I would also be inclined to think your friends were poorly
managing that shop by putting all their eggs in one basket. It was a
foolish thing to do in trusting any large concern to be your only
customer in this day and age of corporate downsizing and
restructuring. Sorry to hear about the shop but I really don't
believe for a second that GM has a hidden agenda to do away with

"Mom and Pop shops" around the country. Especially car stereo joints.

This reminds me of a time when several CB'ers, in the town I was living in at the time, thought I had some inside scoop on the FCC. Every time a "FCC coming to town" scare occurred (at least once a month), they called me to ask what I thought the chances were.

One day, I was listening to the radio as two regulars talked about the latest scare. One said he knew an expert that could tell him if the rumor was true. He told the guy to hang on while he called to check.

Thirty seconds later, he was on the phone talking to me. I told him the odds were not good that the FCC was in town - they had a limited number of field investigators, etc. After we got back off the phone, I heard him on the radio telling his friend that his "expert" said that FCC was not in town.

This happened many more times (others called also - I think he gave my number out). I told each one that I had no special information about the FCC, that I was only guessing. But they continued to call right up until I left town.

Actually, I think I eventually became the center for info on the FCC. Every time they were in the general area, for any reason (once for cable company, etc.), people would call to let me know. Even a radio station called once to tell me that they got a letter from the FCC about a problem and asked me what to do about it (I told them to do exactly what the letter said - and gave them my opinion on how to do it).

Anyway, there is no real way to know what the FCC is doing. I got info afterwards about what the FCC had done, but I never received any advance info that could have helped anyone.

>
> I was curious what a VFO is concerning 2 meter radios?

It is a UFO that has been verified - Verified Flying Object. ;-)

Actually, it is a "variable frequency oscillator" - basically the same thing as the tuning knob on your CB except it is not locked into fixed channels. Many ham radios have more than one VFO to allow quick changes between frequencies and to allow more than one frequency to be monitored at a time.

What the heck are you talking about. Who is this "she" you're talking
about? And what does this have to do with CB?

> Can someone out there help me? Isn't making statements against a "gay
> agenda" akin to making statements agains gays?

No. Saying that you are opposed to certain political actions by a
group does not mean that you are opposed to any specific person within
that group. A person has protections under the law - while your
political actions are not protected from those who disagree with your politics.

Source record: 24739

Don't buy it at all!!! Here's why. The amp you described give you about 1000 watts for a short period of time. It should run around 700 watts and not damage the tubes. 6LQ6 run about $45-$50 each. 10 will get you around 700-750 watts and cost about $500. Four 811A tubes cost $80.00 and will do 800 watts easy. The tubes are tougher because they are transmitting tubes. My suggestion is to buy a 811A box for anything you would use a sweep tube box for.

cut out 4 pieces of wire (Copper is Best) to 96 inches or longer.
connect them to the ground of the antenna mount and set them in a 90
degree horizontal angle from each other and then check your swr. You
can also buy stainless steel rods that are thinner than the antenna
itself and construct ground planes that will support themselves if it
is going to be in the air. You just have to mount them to a ground on
the aentenna mount that is strong enough to support them. You may also
be able to get away with only 3, but I suggest 4 for better affect.

6 watts? More like 60 watts at 13.8 volts D.C. Dont know what it will
do inside the lincoln though. But you should be able to get what the
transistor is rated at if the radio can handle the current.

As above, another option is a vox tape recorder. I bought one here in Aust
for the huge total of 70 bucks and it performs very well with my scanner.

I think what they mean by wind loading is that it will be effected by the
"wind" generated when you drive. I wouldn't worry about it.

> I am not crazy about mounting anything on my roof or hood or any other
> place that might seem unsightly. (To me anyway.) Someone also mentioned
> to me that by mounting an antenna in the cente rof the bed rail behind

> Is this true? How do i detemrine if a location will burn up my radio or
> not?

You shouldn't have a problem with your finals burning up as any modern (i.e.
last 15-20 years) radio will have SWR protection. I wouldn't be placing the
antenna near the body of the car where it is alongside the car body. This
will usually result in a high swr. I run a dual band on my bull bar and
this performs really well - would obviously perform even better if it was in
the centre of the roof but the car is a bit to expensive for this sort of
drastic surgery. There are to many places that you can place antennas for
me to get into it here so your best idea would be to experiment.

2127. Problem with Uniden HR2510

Newsgroup: rec.radio.cb
Date: 2000-02-24 00:00:00 UTC
From: Mike <ki5mp@DOTDOT.arrl.net>
Message-ID: <CF9t4.372$ak5.13590@news.corecomm.net>
Source record: 24746
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.cb,rec.radio.swap

Greetings,

I purchased a nice little HR2510 from an individual and it suffers from low power output. I have replaced both the driver and final transistors and aligned the transmitter section per the service manual. The maximum output power obtainable on CW and SSB is around 15W. The AM output power can be adjusted to its specified output of 10W and FM is also low at around 7W.

In the process of doing some circuit tracing, I noticed some minor differences between the actual main board and the service manual schematic. For example, the service manual block diagram depicts Q134 as a TX AMP, but on this main board there is no Q134 - there is a Q140 and associated biasing resistors in the immediate area instead, for which there is no such component listed on the block diagram or schematic. The board has mounting holes and silk-screening for Q134 and R167, but Q134 is bypassed with a capacitor where the base and emitter leads would normally go.

This may be a dumb question, but is there an "European" version of this radio? This radio was supposedly purchased in the Netherlands while on a business trip and brought back to the U.S. The silk-screening on the main board identifies it as a PB-111AE instead of the PB-111 designation indicated on the schematic. The schematic printed in the owner's manual has the same schematic as the service manual, for a PB-111 main board.

A little more history on this radio may be in order here. This radio was supposedly a 'new' radio but when it first arrived at my door and was tested, it suffered from apparent parasitic oscillations when operated in SSB mode. It operated perfectly on a dummy load, but when hooked up to a real antenna system and modulated in SSB mode, the power output would "latch" ON at full output (about 25W PEP) and not drop back with no modulation as it should. (I might mention that there is nothing wrong with the antenna system - I tried the radio on three different resonant systems with the same results.) I returned the radio back to the individual and he 'repaired' the radio by replacing the driver transistor (Q133). He first replaced the final transistor and this didn't solve the problem, but the driver replacement apparently did. I received the radio back and the parasitic oscillation problem did appear to be fixed, but then I noticed the power output was significantly lower than it was before and the SWR meter no longer worked. Follow up e-mails with the individual yielded no results to my satisfaction but I decided to keep the radio because it is in such good shape cosmetically.

So, I replaced the driver and final transistors again myself and aligned the PLL and transmitter sections per the service manual with no noticeable gain in performance. Digging deeper I noticed the aforementioned minor circuit

differences (and there may be more.) I have a sneaky suspicion that this (or the original) problem may be related somehow to the SWR detection and/or automatic power cut-back circuitry. As I mentioned, the SWR meter no longer works

Is there anyone out there that has a schematic for the PB-111AE main board and/or any suggestions?

Any input would be appreciated. I apologize for such a long post...

Your "real" gain on that antenna is 3.3 dbi. This means that it has 3 bd gain
over a 1/4 wave dipole at the same freq. You can hope to hear a little better
then on on of your old antennas only because you have more wire in the air.
Now that you have the rights to put them higher I would try putting one of your
old antennas at the same highth and see how much difference
the 99 makes..

2134. Re: 102" Whip Question

Newsgroup: rec.radio.cb
Date: 2000-02-24 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <fKbt4.337$7c2.5471@newsread2.prod.itd.earthlink.net>
Source record: 24803

In college I just went to RS and got a 3/8 mount for a hole. The
little chrome block with insulating shoulder washers and a bolt.
Then mounted that in the end of a piece of conduit with a cap
and screwed in the whip.

I fed RG-59 (75 ohm) coax up through the pipe and set it in the
corner of the porch so that 'most' of it was above the roofline.
With a small (100mwatt) walkie talkie I could work all over
campus and a good portion of the town. Late at night, when
things quieted down, I talked to a couple of people on a
pretty regular basis that were almost 20 miles away. But I was
VERY high on a mountain and they were line of sight and all
of them had beam antennas they HAD to aim right at me.

First, get some kind of ground system, or counterpoise. Use
the pipe (or what someone else suggested from the coax)
or make some ground radials.

Then check the SWR. If you make a 'dipole' (like I did with
the pipe or the coax setup) then expect about a 1.5:1 SWR
when the antenna is resonant. (That's why I fed mine with
75Ohm cable. Ok ok, I used it cause it was cheap (free)
but it actually was a good choice!)

101's can go on 11M, the standard method is to replace as many of the 10M crystals with the proper rocks as you desire. Each segment ends up as follows: 26.0-26.5, 26.5-27-0, 27.0-27.5, etc etc mhz.

Crystals can be had new from Jan Crystal in Fla., sometimes they show up on Ebay, or put a post on the Rec. Radio newsgroups looking for them. New ones were 15 bucks each last time I had any burned, which was long ago!

Sounds like the box might be a low pass filter? Used to help stop TVI

>possibly in the summer when leaves are on trees,but i run my antenna in tree
>and it gets out just as good as when it was on chimney,it should be fine

I don't even think in the summer there'd be a problem, I've done it myself and
I know about a dozen other people who've done the same. Works great.
Mike

No it isn't ! What do Sodomites (queers) have to do with CB? CB'ers generally hate SODOMITES (witness the "good buddy" name change to "hand.") Also when the BRIMSTONE falls from the sky, ALL CB & Hambo communications will be wiped out. The government suppose to "remove the sodomites from the land" pursuant to Romans 13 and other scriptures. They are NOT suppose to promote them. Can you see the brimstone comming? I can feel the heat because it is SO close! Repent (turn from your evil ways) faggots before you is a crispy critter! Breaker one-nine--the judgment is at the door!!!!!!!

Since we`re on the subject of "The Flintstones" I gotta tell this story.

Quite a few years ago a friend of mine came up with the idea of marketing Tee shirts with "Yabba Grabba Brew" on them.It featured the Flintstone cartoon charactors and beer.About the time that the Tee shirt sales really started to take off the "The Man" stepped in and gave the "Cease and Desist" order. He had to stop production.That was better than getting sued.If you have one of these,or have seen one of these,it`s a great Tee shirt.
We had some plans to open a "Bedrock Cafe" after the Tee shirts started to rocket.We had just gone thru designing the Leopard skin dresses for the waitresses when it got shut down.Would have been a lot of fun.Seems we were to stupid to figure out we were stepping on "big money" toes.Oh well, live and learn.

I just bought a Power Dynammics power mike with 3 tone roger beep frome someone and it worked great on his radio and when I plug it into my Grant XL or my Cobra 148GTL it squeels really bad unless the miike gain and the power control are almost all they way down and then I am really really quiet and have little to no audio. The limiters in both radios have been cut but my Grant XL in my mobil has a Astatic 575-M6 and all I get from that is great performance! I can run both the radio and the mike wide open with the Astatic on both radios and no squeel. This PDC power mike is for my base radio (Cobra 148GTL and a Texas Star DX250). I Got the mike really cheap so I bought it and I doesn't even looked used. I also tried a new battery and no luck. I had the same problem with another mike (Diesal Echo/RB mike) last summer and just ended up selling it. Any help would be great.

Thanks in advance and 73's all!!

Hello evreyone !!!
I am kind of new to CBing, but have been reading the newsgroup and feel like I have heard many options..
Currently I have some 50 dollar magnetic mount Radioshack antenna with a Midland 77-115. I am getting very short range reception with the SWR being around 1.1-1.2.
So now I am considering istalling a dual Firestick system. However I have a Ford Explorer and dont feel like drilling anything.. I was really thinking of putting the mounts on the luggage rack (I got the idea oe day when I was looking at an explorer type TV van with a metal, rack type band on top with antennas just sprawling everywhere). However I read on the firestik site, that those are not well grounded and would make recpetion bad ?? does anybody know if they are good enough grouds, or how I could solve the problem ??? I think it would be the ideal place to put it. Also the distance between the antennas woould be about 2-1/2 - 3 ft .. I heard that it could also be a problem .. is that true ??
Any help would be appreaciated !!

If you are using it in a vehicle it could be
feedback. I had a PC66XL and replaced it with a
Grant XL in the same location, the Grant
"squealed like a teenage girl under the bleachers
at homecoming with the football team." Turned
out it was feedback from a scanner mounted nearby.
Same scanner was in the same place with the PC66XL
but there was no feedback.

First off an A99 really has between 0 and 3 DBI.Doubling your power is
= to 3DB and 6 DB is considered by most an "S" unit.Therefore IF you had
a 9.9DB antenna the power out would be about 30-40 watts(- feedline loss
of course.This would also be about 1 and 1/2 "S" units.
NO,it does not mean the incoming signal will be amplified 9.9 times
but it will be about 1 and 1/2 "S" units stronger.
In the USA we are limited to 4 watts AM and 12 watts SSB and can't
even use the other modes.

> Sandor KG4FET

Thats not what it means at all,it means 3.3 DB over an isotropic
radiator.Unless you meant DBD in which case you are still wrong because
that figure is referenced to a 1/2 wave dipole not a 1/4 wave dipole.

Yep. Mine will key 3 on AM and talk 40, max swing at 60. On ssb it will talk 45 and max out at a little more. Jerry's Electronics in Houston did this for me and the radio sounds super.

Unit 78 - 27.405 LSB

2173. HELP: Ham International Big Mac 7/8 home base antenna

Newsgroup: rec.radio.cb
Date: 2000-02-24 00:00:00 UTC
From: 26OP 205 <postmaster@twosixop205.demon.co.uk>
Message-ID: <951427033.12332.0.nnrp-12.c2de0ed7@news.demon.co.uk>
Source record: 24842

Please can anyone provide me with information on the above antenna / for sale / specs / owners / sources.

This antenna was manufactured in Belgium by Jide communications under the Ham International badge in the late 1970's to early 1980's

I have been looking for this Antenna for many years and would greatly appreciate any information on this rare home base vertical antenna.

If you have one for sale - I am willing to pay for shipping from anywhere in the world.

Please reply to me if you own or know anybody using this Antenna.

Regards

26OP205 Jon

3 or 4 resonant radials run horizontal attached to the braid at the
feedpoint.Adjust down slightly for impedance matching.

Not legal as a CB and kinda pricey for just 10M not sure of the features so if it's like many grey market radios(Galaxy)it won't be too good for 10M either.99% of things on e-bay can be had much cheaper.

Hi All,

Sense the ARRL and Newsline took the time to slam my buddies name in the NG's I figured I would post my freinds reply to my e-mail. Here it is in black and white.

Return-Path: <n8jva>
<headers edited and clipped for Andy's privacy!>

Hi Chuck
Yep i do remember you how have you been?Im now living up next to Flint in
Linden.
Yep i was set up by 2 hams in the oak park club.O will no problem what comes
around goes around.Any way keep in touch.Nice to hear from you.

73 Andy

You see folks, He was set up! Which only proves what I've believed for many years. The F.C.C.'s System of testing is MAJORLY FLAWED! If someone wants to they can accuse you of something, and produce phoney proof to get your ticket taken away!

SHAME to the MEMBERS of the OAK PARK AMATEUR RADIO CLUB!!!

We should encourage the members of the ARRL to put pressure on the F.C.C. to get RID of the Misdirected, Corrupt, and troubled VEC system, and go back to giving the test themselves!

And that is my opinion!

Hey peak a boo hoo there are people that make web sites all the time just like this. www.Pinkfloyd.com is not owned by pinkfloyd but the owner of the site enjoys pink floyd I'm sure. So go ask him why he made that site.

What kind of answer are you looking for??
Concrete said other then the typos he really liked the site.

www.davemade.com is a very discouraging web site since they are still advertising a raffle that ended September of 1999. And there is no prices on there either. The site I set up allows you to find what you are looking for and get out. That is the point of the site.....

You have a site called watergaterolling and you don't even have any water gates. That is probably because no one ever calls your name. at least when I'm listening they don't........

In defense you may wonder why you never hear me but I can tell you I don't go by Prozac or 625 of the radio so you just keep listening........

2190. Re: Ford Explorer antenna mount question

Newsgroup: rec.radio.cb
Date: 2000-02-24 00:00:00 UTC
From: dbb0003@attglobal.net
Message-ID: <nkhbbsgrtrpq6s0hodd059ukgntsuobk6g@4ax.com>
Source record: 24909

A Ford 'sunroof install specialist' showed me the trick to removing the overhead console (at least the version I have). It snaps into place at the front with metal clips; you just pull the front down and slide it forward (a tab holds up the rear).

The sunroof motor resides inside the console but there was just enough room to install a lug-connector-style flat washer roof mount (I used the one from Firestik). It was a perfect fit and makes an extremely solid antenna mount. To the mounting stud I attached a quick-disconnect adapter, then a 90 degree fold-down adapter (so I can lay the antenna flat for when I pull into my garage, or any multi-level parking parking garage with a 6-foot or better clearance), then a 6-foot Anttron 1700 center-loaded whip.

In terms of performance and convenience, it's just about ideal. The antenna is a good performer, it's located high, and to lower or remove it I just open the sunroof a few inches and grab it! I highly recommend this approach for this application.

I seem to recall that Radio Shack made a VOX unit for the
telephone to allow a recorder to activate when a call came in. I
wonder if this is still available? It was only a few bucks and could
easily be adapted for your purpose.

>
Yes. The wires connected to ground will bring the SWR down. Also, if
you're using skinney coax... coil about 10 loops 8" or 9" in diameter where
the coax connects to the whip. You can experiment with the ground wire
length. Start at 102" and shorten them a little at a time until the SWR
gets better. Also try slanting them twards the ground. Make them look like
a camera tripod that's too wide at the bottom. This will improve the
impedence. 3 or 4 will work well. Have fun! That's what it's all about!
:)

2198. Re: HELP: Ham International Big Mac 7/8 home base antenna

Newsgroup: rec.radio.cb
Date: 2000-02-24 00:00:00 UTC

Jon,

>Please can anyone provide me with information on the above antenna / for
>sale / specs / owners / sources.
At the time this antenna was on sale here in the UK it was relatively
expensive and few people bought them.
>This antenna was manufactured in Belgium by Jide communications under the
>Ham International badge in the late 1970's to early 1980's
>
>I have been looking for this Antenna for many years and would greatly
>appreciate any information on this rare home base vertical antenna.
I'm pretty sure this antenna is no longer in production. Anything taller
than a 5/8 will have extra high angle lobes offering little if any
improvement in ground-wave performance.

While I admit there was a lot of metal in the air it really did need
it's guy ropes to keep it strait!
>If you have one for sale - I am willing to pay for shipping from anywhere
>in the world.
If you want to have a super performing omni then you'll not go far wrong
than talk to Jay out in California about his mod's the the old Hy-Gain
Golden Penetrator 5/8 with 4 x 1/4 wave radials.

If you want more performance than something like this can offer then I'd
humbly suggest you consider a directional array.
>Please reply to me if you own or know anybody using this Antenna.
I only ever spoke to one guy up in Birmingham in or around 1980 with one
of these. It eventually blew down!

Good luck should you decide to continue your search.

Phil / UK
PS. Try your post on the UK CB ng.

Did you ever chase it down? When it starts dose your S-meter increase then decrease and then
change the channel and see if it has shifted to a different channel. Now, is there a navel station within approx. 20 or 25 miles of where you operate?

I get this sweep where I live. It's caused by the ship yard where I live. On local has tried to
pass it off as a RF sealer. For sealing heavy Mil. plastic bag. I don't beleive that story. My
conclusions are Possibly it is testing of sonar from the Navel ships. I feel that theory is is a
little to far fetched.

I beleive it is Nevel vessels testing their Radar systems. And what is happening is its a harmonic that is causeing the sweep. What we call Shipyard Sweep.

AB7RS:
What does this have to with CB, I believe that we are on a CB news-group not the rec.radio.amateur.misc or anything else newsgroup. Personally I wouldn't have a extra-class unprovisional license if the ARRL and the FCC gave the damn thing to me. Why, you are living proof. Stuck-up, arr-gant, opinionated snobs. And I want to study my ass off and spend $$$$$$ $$$$ of my hard earned money to listen to the likes of you. !!!!NOT!!!! Yes, we poor Chicken Banders are dumb as a stump,lazy to the point we can't learn code, appliance operators, we fight all the time on the air, provide intentual interference to other cbers and curse. Sound like some of your favorite HF freqs you use Tracy? What ranks of radio did you use before migrating to the Extra-class amateur ranks and why look down on the route you took. We have to listen to enough dribble on the band that we use without coming up on the news group and have people such as your-self belittle use also. Live up to the amateur name or drop down to our level and prove to us lowly chicken banders that we should join you up on HF bands, to be belittled once again. Get with the program of educat-ing just one cber into becoming a good operator or keep your opinions to yourself. And I suppose you've never drifted your VFO'd MARS modified rig down on your ole haunts and blasted some poor cber with all the power you had to disturb him. RIGHT. You're one heck of a ambassador to the International Radio Community..... 73s&51s OM

I think some are lost on the db issue. This is how it breaks down: db= decibel (We all have that
past down).

Now you need to know which db your dealing with.

dbd is Decibel gain over a "Referenced dipole" which is an actual antenna that is used a s astandard to figure the db gain over a unknown antenna.

Now, dbi is decibel gain over a "Isotropic antenna", which actually doesn't exsist. Only on paper. It is consisdered to be a paper antenna. Cause thats only where it exsist (On Paper).

now there is a another type of db being molested here, and that is the decibel (db) itself.

db is calculated with this formula: db = 10Log (P1/Po), Where Po is the power you want to use
for comparison, and P1 is is the power you are compairing.

Say 1 watt input to a rf amp, and the amp outputs 100 Watts, whats the db gain of the amp?

10 log (100/1) = 10 Log (100)= 10(2) = 20, The amp has a gain of 20 db. See the important fact
that was being lost is db is not a number that you multiply by, becuase decibels are a Logarithms.

To calculate how many times your power is increased, just remember this 3 db gain for Power is a
doubling of the power. This holds true for power and only Power gain.

When referenceing Voltage or current, it takes 6 db's of gain to double the voltage or current.
Hopefully I have helped a few to understand the basic principles decibels.

I am aware of the problems with the NEW Cobras, and even The NEW Grants. Actually my question
was directed at Hippie Freak. He said he would take his old Grant XL/LT over a Cobra 148 GTL.
Consisdering the older 148 GTL, and the Grant XL were the Exact same Chassis design. NO different. There where built together by Dynascan, and uniden. Just the exteriors where different.

Funny I have only come across very few, and I mean very few 2950/70's that have had boards cracked. Most of the time if they were it was cause some one normally didn't have the radio mounted securly and bounced the damn radio all over the place in their vehicle.

Hey Money, I don't where CD lives but I bet it's not illegal to mount big alternators in the Mini Grass!

Anyway, I'll send the pictures Sunday or Monday that way I can include some of the other setups from the shoot-out. The weather will be fine and it looks like we will have a big turn-out.

2218. RANGER RCI-2950

Newsgroup: rec.radio.cb
Date: 2000-02-25 00:00:00 UTC
From: "Jacek M. Holeczek" <holeczek@us.edu.pl>
Message-ID: <Pine.GSO.3.96.1000225114124.27480A-100000@uranos.cto.us.edu.pl>
Source record: 24767

Hi,
I've got my hands on a Ranger RCI-2950.
Unfortunately there is NO manual at all.
Does anyone knows where can I download the manual
(as PDF for example) ?
Just by pressing different buttons and turning
different knobs (you know - monkeys and other
dumbs learn this way :-) I think I was able to
"discover" most of available functions, but not
all.
I've got two problems.
The first one is - the knob that is placed just
above the mic plug is supposed to change the
frequency, exactly as the up-down arrows and the
buttons on the mic, but it does nothing (I would
like to say here that BOTH the up-down arrows and
the buttons on the mic DO change the frequency).
Is there any known (typical) problem with it ?
The second one is - sometimes when I press a
button like "SHF" (or "LOCK"), instead of the
required function to be performed a frequency
change happens like I had pushed the up-down
arrow. Is there a know fix for it ? (Well, it
doesn't happen very often, but ... I don't like
it. ;-)
(Actually there is a third problem - I need to
replace the battery ... but I think I can easily
manage it myself ... the battery is already out
... and I am looking for a replacement :-)
Thanks in advance,
Jacek.

well i will tell you what, you are right about that, but a long time ago there were certain law officers, if you want to call them that , who used linears while at work, and talked on their radios , which is fine, but if you make your bed , now you must lay in it. and i the great curious, blessings and peace be upon me, used to have no , and i do mean no compassion towards them , if i heard them on the air. they were told in no uncertain terms of my opionion of their activities. and you know why, because these same people ratchet jawing with you, could also make your life miserable in any number of ways and if you were a working man and had no connections, there was nothing you could do about it. therefore i the great curious do have a hard on for cops of every stripe. as a rule , i don't like them. i consider them much more trouble than they are worth. they are nothing more than uniformed tax collectors. heck i don't want to hear about how they love serving people . don't make me puke. so excuse me for messing with big money, he shouldn't have told old curious he was a sheriff, now he is on the curious short list, no doubt,......cd is out and hiding from da laws.....

Sent via Deja.com http://www.deja.com/
Before you buy.

Wow Ice I didn't know we were so close.

'<<<>Cause one party is quick to defend the other.>>>>

stated a fact about "rap" and thats defending each other? well arnt we a
sharp one mr. 352

But
> that's O.K. I expect it from a couple of knuckleheads.>>>>>>

All I said was that
> RAP SUCKS. And I am entitled to MY opinion.

well U know what they say about opinions.

I mean, maybe if I wore my pants
> with the crotch hanging down between my knees,

sound like wishful thinking about your own anatomy.

and my Raiders hat on
> backwards, and said, "YO YO...Know what I'm sayin"...

cant exactly remember the last time I seen a rapper wearing a Raiders hat,
oh but were stereo typing, I forgot.

<<<then perhaps I could join your group of 'intellects.'>>>

Well you could try, but Im sure that your inbred cranium, cerebral cortex of
comatose gray matter would have a hard time catching what the naked eye
cannot detect. Meaning Rap as you call it, I prefer Hip Hop my self, has a
kind of code you see. Kind of like the matrix, you know the movie. See your
brain capacity is limited and only they possessing the biochemical
composition can have access and applying some. Got that? Great!

GEEZ... grow-up BOYS. I profusely

It is a better idea to keep the antenna as far away from the engine as possible,
but I have observed a bunch of people that used trunk mounts on their hoods since it was easy, and did not require any drilling. Of course it depends on
how your hood is constructed and what type of trunk mount is used.
It is all in your priorities, if you want top performance, you want to go with the
102" whip, I understand that not everybody wants to cut holes in their rig for
that little extra performance, but the use of a wilson with a magnet mount is probably one of the better solutions. I use a 102" that I recently installed
instead of the RatShack $50 mag mount. It increased performance--but
not as much as I would have thought. The RatShack actually worked well
for me since I don't run any power. One of the reasons I changed is that
I Might run power in the future as I have some amps that are just laying around at present collecting dust.

Yeah, I decided that that would be the deal. Unfortunately a lot of good
antennas
went down when Big Brother decided that they were not safe to put up since
so
many were electrocuting themselves in the process. For myself, I think they
should
have won the Darwin awards for those years--unfortunately, I don't think
they had
them then. After the the Government got involved or whoever it was at the
time,
the only antenna you could by was a Shakespeare Big Stick and it SUCKED as
far as I was concerned. I bought one and my dad bought one--Neither one was
worth the powder to blow it to hell with. Both could not talk across the
street, and
both had a terrible SWR. I remember several people telling me what great
antennas they were and I just smiled and nodded.

Tried one and it is CRAP, at least the one I just bought is--however the
basic
antenna itself is ok, and I can use it as an antenna on my El Camino.

I have an inverted V that I bought from Antenna Warehouse that works
reasonably well, but if you are strapped for cash you can make one
out of old coax or any good stranded copper wire. approx 9' by 9'
and soldered to a SO239 connector--one side to the center conductor,
and one side to where the shield would go.

Or you can use a Magnet mount on your refrigerator which is not enough
ground plane but it is close--I use mine and have under a 2 to 1 SWR and
talked to a guy 20 miles away when the DX got quiet.

Are you using the same Amp/mic combination?

Either/or have caused this before.

A lot of people replaced the glass whip with a steel one on those early big
sticks,yeah you think back on it and about all of the
antenna's,ringo's,avanti,etc.,now there would be a challenge for our friends
across the Pacific,copying a few of the better old time omni's,

Agreed!

But with some good antennas they will work as well as mobile units.
I used portables for years--and still use them now and again. BUT--
do not expect much from those stupid rubber ducky antennas they
come with. I used to hate the 4' telescoping kind because I could
easily use a mobil or throw a dipole over a tree and talk 10 times as
far. Course you can't always do that, but with the telescoping antenna,
I got the best range while moving (walking, biking, etc). The first radio
owned was a walkie talkie and as long as I hooked it up to a good
antenna, it worked like a champ for me.

Saw a good mounting idea that never occured to to me, one of the newer SUV's running ahead of me,had a mirror bracket mount,mounted to theswing out tire rack,to the far right side, real clean setup ,wasn't in front of me long enough to trace the coax, but if I had one of the newer rig's,be doing the same.

Prozac,

It sounds like you got a match problem somewhere. Check your
antenna(s) jumpers (using a ohms meter) (if you know how, if not, ask,
and I'll tell you) and also you might want to have the amp checked
too, sometimes a bad input circuit can cause those types of problems.
(Also keying circuit) What I tend to beleive is that somewhere a high
SWR is feeding large amounts of rf back into the radio.

hope this helps!

Phil!

You are correct on the blow down. That is if those are the ones I remember.
They were really tall not even counting the mast.

Also, you are the first person on here that I ever saw mention the
"Golden" Penetrator 500. I have observed many posts on the Penetrator, or
Pentetrator 500, but only a few ever mentioned the Golden Penetrator. I
asked
about it and one individual said it was the same as the Penetrator 500 with
gold plate that wore off. I don't remember it that way, but my brain I
damaged
long ago.

This absolutely cracks me up! You were the Radio Guy so you knew
everything that had to do with radios--whether you did or not.

I have had the same thing happen to me as far as computers go, I once
made the mistake of telling someone how the set the IRQ's on his
computer to resolve a problem, and since then I have been the
"computer guy" if they wonder what in the heck Microsoft is
doing, they ask me. I haven't got a clue, although I tell them
if they can figure out the money angle, they are half way to
answering their own question.

Having difficulty find wire color codes for new rat shack power mic. Pin connector already cut off so colors all I have to go by.
Colors are: red, white, yellow, black, and shield.
Thanks Ken

Count me out of my mind, I bought one brand new for $350, then was so very sorry--until I sold
it for $300. I was happy I got rid of it for anywhere near what I paid for it.

All the Teaberry Stalker models I bought were SSB, I did not
know they built Stalkers that were AM only. Do you have
more info on these? I am a Teaberry guy, what can I say?
I have a Teaberry Stalker XX and a Stalker I that works real
well. I also owned a Stalker II that was a good radio.

Ask Jay "in the mojave". I think he can give you the best advice.
I like the M400, but Jay had trouble with bleedover and/or TVI. I
Would go with a MaCo 5/8 in your area.

Here is what Jay had to say:

"The MaCo V5/8 is not made as well as I would have made, but it does seem to
hold

up to the high winds of the Mojave Desert. I have seen the vertical element
after a long time wiggle out of its insulator base assembly, and the
impedance
matching loop gets hammered by big birds landing and taking off from it.
Which
appears to mess up the match. The MaCo assembly instructions say that the
impedance matching loop, must have a 1 inch clearance between the lower and
upper sections. But when the birds do Touch and Go's off the loop, it gets
all
bent out of shape. One of the locals here has made a trick kit that installs
onto the MaCo V5/8 that installs insulator type spacers on the loop, making
it
much more steady. And they have added a special clamp to hold the vertical
element in its place."

As I said, I would ask Jay for info on antennas in the Mojave.

?? I just called him and ordered.

I supply a few old guys around here that would like to get back
into CB, and they do not want to spend for a Galaxy, RCI, or
whatever. So I get them a radio like they used to have-or one
similar.

Unofficial: Hat Trick CB.

That was where he shipped to.

Besides, I operate off of the Nisqually Reservation and they have not yet
decided to license every business that is there. Only the Casino and the
Fireworks stands.

Yup, ,me too. I started with a Rat Shack TRC-47 (which I still have one)
and
then got into Cobra, Teaberry, and Hy Gain. I have Teaberry Stalker !, and
a Hy Gain, and a TRC-448 that all work perfect except for the Hy Gain-which
only works on SSB.

Yes, I once had a brand new Jeep that I foolishly did not want to drill holes
in, and so I had a heavy duty bracket made that fitted under the spare tire
on my Jeep. The spare tire was on a swing out mount and so the entire
assembly swung out of my way when I wanted to get in the rear of the Jeep.
It did not have a great SWR, but it worked ok. Later on a CJ-5, I just
went ahead and drilled the holes for a ball mount and was very happy
with the way it worke for me.

Yeah, I found an antenna that is a copy of an old Starduster M-400.
I am still trying to talk my Landlord into letting me put it on the roof of
the apartment I'm living in now. His partner came up to me today and
showed me some great pipes that run up the side of the building and
asked if I would or could use those--unfortunately they are about 3'
from the power lines and I told him that was not a very good idea.
Even with an old Shakespeare Big Stick. I do remember putting
a Golden Penetrator up in a 150' Douglas Fir and then the local
power company building a substation under it and later calling and
me telling me I couldn't put an antenna up there. I told them that
the antenna was there before their substation, and if they wanted
it down they would have to do it. So they did, and used the biggest
cherry picker I ever saw to do it with. They gave me my antenna
and had it all taped up just like I had it when it went up--kind of
freaked me out at the time.

Message-ID: <38b6d022.48626160@news.thegrid.net>
Source record: 24870

Reset the microprocessor... On older 2950's, (same place on Saturn
Turbo's) there is a little white button on the inside behind the
control panel. Push and hold that while you turn the radio on then let
go of it. On newer ones, Turn the radio on and off 2 times real fast
then back on! Its obvious since both radios is now doing it, that
there is either a problem in your feedline or antenna. I take it that
the 2950 came out of the mobile?
If so, Try the Saturn Turbo in the mobile (If the processor resets
correctly) and see if it functions right.

Body handling: HTML body converted to readable text

Not much to add about this model since it is the first Teaberry that I found that was AM only. On the inside it is exactly the same as a 29 LTD or is it GTL? Oh well one of those! But it does have the same bells and whistles as the 29 except that the knobs on the front pull out for other functions like, Pull on the Squelch knob and it goes to PA mode, Pull the SWR Cal knob and it dims, Pull on the RF Gain knob and it Kicks in the High Cut Filter. Built in SWR/ANL/NB etc... Just like the 29's. It is also modifiable via the pll chip but sets you in between the channels so you have to unlock the delta tune to slide on freq. Very nice rig just for AM but it has a slight problem at the moment. When the Mic is keyed, It wont TX and the LED's go out. So that is in the fix. This is the Teaberry Stalker 5! I also had a Teaberry Stalker 9 That was the exact same thing as a Old Grant (MB8719) board. Another SWEET Radio. Had a different mixing crystal in it than a 148 and it would take you more below than the 148's.

How close is it to the tree? If you can manage it, I would suggest that
you put it up in the tree. If that is not an option, and if you can, try
and
keep the branches trimmed back at least 10' from your antenna.

2276. Ham International Big mac Antenna

Newsgroup: rec.radio.cb
Date: 2000-02-25 00:00:00 UTC
From: 26OP 205 <postmaster@twosixop205.demon.co.uk>
Message-ID: <951508601.21066.0.nnrp-04.c2de0ed7@news.demon.co.uk>
Source record: 24875

Please can anyone provide me with information on the above antenna / for sale / specs / owners / sources.

This antenna was manufactured in Belgium by Jide communications under the Ham International badge in the late 1970's to early 1980's

I have been looking for this Antenna for many years and would greatly appreciate any information on this rare home base vertical antenna.

If you have one for sale - I am willing to pay for shipping from anywhere in the world.

Please reply to me if you own or know anybody using this Antenna.

Regards

26OP205 Jon

It just goes to show that what you see is not necessarily what
you get. This looks like the old smoke and mirrors routine to
me. Clearly the manufacturers by stating that an antenna has a
9.9 db gain would by inference suggest that the antenna has just
that, a 9.9 db gain. What you are suggesting is that the
manufacturer is trying to compare apples with bananas, thus
being rather economical with the truth.

This brings me to my next question---Is it possible to get a
true 9.9db gain from an antenna?

" Trunk lip mount" refers to a type of mount that sandwiches a flat horizontal metal surface and can be used on a deck lid or hood and often is.Another type of mount that would work in the same location(hood to fender seam)is a simple "L" bracket.
AS far as this location making the system more likely to be efected by engine noise,NO I don't think so.Engine noise(thats what you call it) can be a problem regardless of where you mount the antenna and can be eliminated regardless of where you mount it.

The interference did not exist a year or two ago. The pattern is very unique that I can follow
it from one channel to the next through all 40 channels and then start all over again and again
all night long. It occurred mostly at night only. Sometimes it swept through very fast. But sometimes
it would stay on a channel for half a minute. When it stayed on a channel longer it would start out
very soft and gradually turn louder and louder, then it would reverse that and eventually it would
stop. When it stopped that's when it started out on a next channel. This would go through every
channel
then repeat all night long.

There is a Navy shipyard 30 miles north to where I live. But the shipyard is already closed down.
There are only a few Navy cargo ships there. I do think the interference is not easily produced
by any CBer or Ham operators. I am not complaining anything. I just wonder if anyone else in this
region hear that too.

That could be it. At night the sky is a lot quieter. During the day there are too much skip
in the sky. The sweep does not try to beat the crowd. I did not try to chase it down. I am

not bothered. I turn on my radio about a couple of minutes a week.

A friend of mine told me my RCI 2950 only dead keys (i.e. no audio) when I tried to talk with him. This rig has had all the mods done to it. Does anyone know of a mod that would have caused this or is there something else that needs to be done to make it work in CB range?? The radio will display the CB channels and everything when the right buttons are pressed.. It's hard troubleshooting up here cause not many people use CB. Just want to make sure it works before I head to the lower 48 this summer.

Paul Jordan

Yes, just use this call ......AB7RS. I don't think he'll mind???
After all, this is a help group. Some where along the line he
has to become helpful. The use of his call seems to fit the
bill.

At least it makes sense to me.

has any one any information regards this rig?
ive searched everywhere on the internet and i carnt find
any info.Is there a web site out there, does any one no
where i can get a workshop manual or operaters manual?
this rig covers 26.500mhz to 30.1900.The power goes of the
scale on full, whats safe? any information would be
appreciated. CENTRAL UNITED KINGDOM.

> I am just glad they are lowering the code requirements to let more
people in. Also I guess it now will make me an Extra Classic instead of
an Extra Class.. I have found that the ones that talk in the Extra
portion of the bands are a bunch of snobs and I had no desire to talk
there, but then I think those are the same ones complaining. Anyhow now
we will have plenty of people that will be able to use HF and will be
plenty to talk to. I cant wait for April 15th, Getting a Tax return and
some new good buddies on HF. and I never owned a CB:). Oh ya, Im not
gonna turn my VE Badge in. Im gonna roll with the changes and still
enjoy Ham Radio. Thanks and Carry On Good Buddies

Source record: 24930

>
>Hey Otis,
>
>
>Just out of curiosity..............who are you referring to?.............And
>what has "Gay" have to do with CB radio?
>

To the Group:
We tracked this down. Otis does daily recaps of the Dr. Laura show and posts them to another newsgroup.

His message referred to the opening (1st hour) monologue for 2/23/00 when Dr. L. reported that a gay group had taken out full-page newspaper ads about her.

So that's the explanation. How it got into the CB newsgroup is still a mystery. And don't worry, boys. We KNOW you are as straight as your 108" whips!!!!! (And I don't necessarily mean the antenna on your CB). *grin*

Best regards,
QRM

2312. No Ground/limited Space, CB Antennas On Ebay (DUTCH)

Hello,

I Have no ground limited space antennas on a Ebay Dutch auction at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=266135828

These will mount virtually anywhere, and are a good alternative for
those who can't install a full size antenna.

Thank You

Make me an offer on this set up. It is fully modified(Channels) Modulation Booster installed(On/Off) switch on back of radio. This booster really blasts through QRM on SSB and on AM you will be the envy of all who hear you. Radio is 4 months old with original box for both Microphone and Radio. I also have an Anttron 305 w/Belden Coax. This radio was up for auction and received no bids, but is a very good investment and will bring much joy to the one who uses it. E-Mail me with serious inquires only. I paid $620.00 for the whole set up which included a re-alignment to ensure all functions better than from the factory. I live in Newark,Delaware and if you are close by you are welcome to check it out. It has been packed up for 45 days now since I moved and stock microphone has never been used.
Mike

no i am not a english teacher, but unlike protazoac, when i went to college i didn't eat my books. now tell me something big money , what does the high sherrif of nottingham want with big cb stuff. i thought your sworn duty was to uphold the law, and not break it. that is of course , you are kidding about being a sheriff or you are on the pad, which is probable the way things have been going of late. you know look the other way while things go on in your precinct and get your palms greased. i am hip, no doubt. just pay me my cut and deliver me a case of royal crown or canadian club every friday. then it is cool. oh well. ooooooooorrrrrrrrrrrrr, perhaps you are another security officer tripping on your rusty 38 and your barney fife bullet or something. we got lots of those idiots in dallas that get on here and jump up and down. anyway peace brada,......cd is out...

: 99 with a gain of 9.9 db. Does this mean that the four watts I
: put in the bottom of the antenna is now forty watts when it
: leaves the top. Also does this mean that any signal I receive is
: amplified 9.9 times when it reaches my rig?

Don't believe those figures. An Antron will have about 2-3 dBi gain
(gain over an isotropic (imaginary point source) radiator).

9.9 dBi would mean approximately 10 times the gain. 9 dB is 8 times
and 10 dB is 10 times.

That is not an increased power output - you cannot get power out of
nothing. It is what is called "effective radiated power". What it
means is that the radiated signal is squeezed vertically - so less
of it goes straight up and down. This produces an apparent increase
of power at angles closer to the horizon.

Yes, the signal would be about 10 times stronger than wiith an isotropic
antenna, if the gain figures were true.

Yes it is still available. In fact, there is one available that
may be plugged into any phone jack to monitor any activity on that
line whether the local extension is lifted or not.

In case you haven't read my other posts I have done something to make my Saturn turbo stick in TX mode.

Now I have been bringing in my 2950 to substitute and guess what? It is now stuck in TX mode.

Can a bad antenna fry my CPUs or maybe something in the mic?? I never heard of such a thing.

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition
with copy of manual $250.00 (Pending Sale)

Swan 1200W 10-80 Meter Amplifier, Very Clean Condition, Uses 4 6LQ6 Tubes
With Manual. $250.00 Pic will be on the WebSite Soon!

Yaesu XF-32A SSB filter for FT101 series, $40.00

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced!

Commercial VHF Handhelds:
Motorola Radius P50
Kenwood TK240 with drop in charger
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $150.00 Reduced to$130.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and
D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required $150.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB, Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics Mere, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

Alan K1313 10 meter Single Tube Modulator With Spare 6KG6 tube, New Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a Demco Tube Modulator. Smooth Clear Audio! $200.00

Misc, Yaesu FT101 Components and parts, Misc untested boards Email If you need something.

Electrovoice Mic.... See Website!

Source record: 24947

Point is this, the site is set up to show off some of the keydown vehicles that our bunch of guys use, in a keydown a watergate is as critical to the outcome as the systems keying. it is not a skip site, it is a keydown mobile site. I did not say that the site looked bad, I asked why you did it. If you are so upset with my site, take a poll and see who gets the higher score. I got a slew of down to earth photos and a slew of watergates, but keep in mind that at a keydown you have to win the class to get the tape, and who would want to listen to us on the watergate. You are just a just a dickhead to anyone that does not worship DaveMade. And you are a no one to the people who do run Dave's, I like everything about davemade except you. You do to much assuming, try a little hands on yourself before you run your head, you don't know dick about the amps from down here in the south, if you were into keydowns and seen a line of amps do more than yours, and the beat you on the line you would have second thoughts about what you are running now, I am not saying this would happen but if it did you would feel the same way you did when you realized that Texas star was no longer the best in your eyes. People like you come a dime a dozen, but most of them are either to broke to own a computer or to dumb to operate one.

From: Philo@gecko.net
Message-ID: <MPG.1320cd272cd7ce9d98968a@news.jps.net>
Source record: 24952

Do you have a spare tire carrier on the back of the vehicle? That is usually an excellent place to mount a relatively modest antenna. Mount it as high as possible! I would suggest a 4' Firestik Firefly or a 4' Wilson FLEX Silverload since they work great and are very light and efficient for their size. Otherwise Firestik's website has a Hood Channel mount that does minimal damage but it puts the antenna right in the line-of-sight which gets annoying.

2334. Inexpencive, good working CB's from The Antenna Man

I own a cherokee AH-100 (am,ssb) and works great. comes in handy when you don't have access to a mobile or base. When you get a handheld, be sure to get a telescopic antenna.
Good luck
Randy

My dial acts that way if it's below 32degrees F in the truck. The manual gives 32deg as the lowest operating temp anyway...at these temps the mic channel buttons don't work either. I wonder if it's really moisture that does it, wouldn't that be the same as dirt? I'm afraid of the solder joints on the board anyway so I don't operate it cold unless someone calls me.

Its crazy, isn't it? And no matter how many times you tell them that you don't know anything more than them, they keep calling anyway. You tell them and they seem to think that you're just being modest. It was one of the strangest people things I've ever seen. And, to this day, I still don't know what I did, or said, that started it all.

One well-known guy on the radio in that town even thought I worked for the FCC and was spying on everybody - like the FCC had enough people to place an agent in a small town to watch people for years. Several people told me he said this, and he avoided me like the plague the whole time I lived there. There are some strange people in the world (yes, I know I'm one of them, but that is another story).

Hey, by the way, since you know so much about computers, what do you think Bill Gates if going to do if... ;-)

Now Bill, New York may not be the best place to live, and the people may be a little strange, but that is no reason to say discouraging words about the place.

Besides, if they burn the town down, some of the people might escape and move to my area. Let them stay in New York where they can cause the least damage to the rest of us. :-)

And they should have been found not guilty of murder or homocide.
Yes, they went too far and reacted poorly to the situation, but it was
not murder or homocide.

However, I do think that all of them should be booted off the police
force and never allowed to touch a gun again. Lets just say that I
would not want to run into these guys on a lonely street at night.

The FCC is the best. They need to be more aggressive. There are some people that run over 1000 watts and getting a 3500 watter in two weeks or I guess so. That is so ridiculous, I can talk just as far and just as loud than them and I use a Uniden Washington with Silver Eagle with a 50 watt modulator. So if you are on of those guys with over 1000 watts, please quit using them, cause sooner or later your going to get caught.

The big knob above the mic plug sometimes skipps, i.e., the
voltage change that it is supposed to generate to simulate
the up and down arrows isn't being generated. This even
happens on new ones some times. However, if it is consistent
on your radio, the pot may be dirty. Take off the cover and
see if you can find a hole in the pot. If so, buy some contact
cleanner and spray it in there. That is the simple thing to do first.
If that isn't it, let me know and I'll look at my schematic and try
to figure it out.

Time to find the reset button on the back of the front
pannel! Your CPU is acting strange. It is a little white
switch. Turn the radio off, depress the button and turn
the radio on while holding the button. Then release.

You will need to do this when you replace the battery
so do that first.

John

Get yourself a 3/8 drill bit and drill a hole in the middle of the roof. Then shove in a NMO 3/8" hole mount and run the coax. I've had good luck with 1/4 wave (19") whips on 2m. NMO mounts are the most versatile and you can put on all sorts of different antennas if the mood hits you. Dirt cheap too. Diamond antennas are basically a rip off. The coils break in the middle and the gain claims are a joke. When you go to sell the rig shove in a cheap 800MHz antenna or fill the hole with putty and wet sand (easy).

yes i am a hockey fan, no doubt, we don't have it down here, but i am
jealous of those that do. it is a great game. the mistique of the ice,
no doubt about it. i played for over 15 years. i played with mostly
yankee boys, and canadians. they couldn't believe i was a home boy.
they thought i was from up north too, but nope , learned how here. i
have never played a game that got you so pumped up as that game. there
is none like it. to be able to skate like you are walking or running
and for it to be second nature as you use that stick, there is a lot to
it, no doubt. we used to play for about two hours, then go get shit

faced and i am here to tell you that it didn't take much to get me there. after skating hard for two hours, your blood is definitely thinner, no doubt. and what is funny is that there are those around here who think that cb is a sport. i am afraid that is not correct. cb is a thang, and that is all there is to it. hockey is a sport and i would venture to guess that most of these fat boys that hang around here couldn't skate for a hundred yards , much less run a hundred yards without suffering a massive coronary. i played with a lot of canadians who used to be pros. the biggest drunks i ever saw. hockey and beer seem to be synonymous. it was fun and still is for some. old man had to give it up though. too expensive to be a practice dummy for the kids. oh well. life goes on. santana said at the grammy awards that this world doesn't necessarily belong to people between the ages of 17 and 29. well that may be true in music, but it is not true in hockey , you are an old man when you get in your late twenties in that game. and that is my roger,....cd is out.....ps. mcsorley is a goon, cd out again.....

Won't disagree with this. Larsen makes a fine bunch of antennas. But I've found the 10m unit has a pretty narrow bandwidth. Have been using a Sirio HP3000 most recently, but nothing beats the Les Wallen Modulator for bandwidth. I don't know what the Wilson 1000 is like, but the Wilson 500 I have isn't as wide as the Sirio nor as efficient.

Pull out the transistor and use the diode check. If any two (or more) leads register a short the tranny is whipped.

If the transistor in the other radio is the same then by all means, replace it. I know that Kiwi radios are only 4W on SSB so that makes it relatively easy.

> A friend of mine told me my RCI 2950 only dead keys (i.e. no audio)
>when I tried to talk with him.

The first thing to do is go into SSB mode and talk. If you're putting out audio, you will see the bar going up when you talk. A couple other things you can try:

1. Ensure the mike gain is turned up on the radio
2. Ensure the mike volume is turned up on the microphone (if there is one)
3. Check the battery in the microphone if it's a power mike.
4. Try changing mike's.
5. Hook it up to a meter that has a modulation meter.

>Do the cellular look alike antennas work well for two meter mobiles?

Not that this has anything to do with CB radio, BUT... yes, they work fine if you're in an area with decent repeater coverage. You lose a lot from a 5/8 mag mount, but it will work at an acceptable level.. you certianly won't get any early morning DX from it like you can with a 5/8...

2369. Re: RANGER RCI-2950

Problem 1: The dial not changing the frequency: Your dial is broken. There is no button required to be pushed to make that work.

Problem 2: Frequency changing when you push another button like LOCK... you battery needs to be replaced.

Problem 3: Your battery needs to be replaced: This should fix problem 2.

My dial doesn't perform properly.. sometimes moves freq's in the opposite direction, or skip or jumps around freq's, so I just use the up/down arrows.

Replacing the CPU is a synch but what is the real source of the problem this can get costly. I'm afraid if I send the radios out to get fixed It will happen again.

Could a possible voltage to the wrong mic pin be popping my CPUs? I never thought you can fry a radio by wiring the mic wrong. Not that it is wired wrong but maybe internal mic problems are doing it. The mic works fine modulation wise.

Most people I know replace this channel selector with the echo control and use the arrows since they don't change channels that often anyway.

It is a very common problem with them channel selectors it is even worse with the base stations since the bigger knob forces the switch to spin much faster. Don't bother fixing it unless you are one of them compulsive people that needs all the gadgets to work even the ones you will never use like split freq.

I'd say that the problem your having is testimony to the mic's ability to modulate,just turn things down a bit,and it should work fine,even though there are better quality mic's to do the same thing, you should be able to work the bugs out of this one, good luck,

I also had a
Teaberry Stalker 9 That was the exact same thing as a Old Grant
(MB8719) board. Another SWEET Radio. Had a different mixing crystal in
it than a 148 and it would take you more below than the 148's.
<<<<<<<<<<<>>>>>>>>>>>
That was the same radio as the original Cobra 148GTL DX! Uniden PB-010 Board.
Awesome radio... Lots of audio....

-----> Equipment For Sale <------

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition
with copy of manual $250.00 (Pending Sale)

Swan 1200W 10-80 Meter Amplifier, Very Clean Condition, Uses 4 6LQ6 Tubes
With Manual. $250.00 Pic will be on the WebSite Soon!

Yaesu XF-32A SSB filter for FT101 series, $40.00

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced!

Commercial VHF Handhelds:
Motorola Radius P50
Kenwood TK240 with drop in charger
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $150.00 Reduced to$130.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00 (Pending Sale)

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and
D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required $150.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB, Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics Mere, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

Alan K1313 10 meter Single Tube Modulator With Spare 6KG6 tube, New Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a Demco Tube Modulator. Smooth Clear Audio! $200.00

Misc, Yaesu FT101 Components and parts, Misc untested boards Email If you need something.

Electrovoice Mic.... See Website!

Misc 19" Racks, Email for Details

Will Trade For Mustang 5.0 Parts!

To see this Equipment and More equipment and Pics go to:

http://members.aol.com/radiodoc37/indexdoc.html

Modified components to build your own Rife-Bare
Resonant Frequency Therapy Machine, Modified
ISM transmitter, Modified Class C amplifiers,

Source record: 25008

Charlie has been at it for a long time. Sometimes he says he's in Colorado, other times just on the "Indian Reservation". He's in Phoenix. The trick with Charlie is just to talk and not get pissed. If he can get under your skin, he will drive you nuts. If you make a contact with him and exchange numbers, he can be quite pleasant. Annoying, but pleasant.(How's that for the oxymoron of the day?) But if he has any clue whatsoever that he's pissing in someone's cornflakes, he goes on and on and on and on....like you said. Been hearing Charlie on and off for a few years now. Shock value is what he's after. Don't give it to him and you win!

Tim Nebo wrote:

> there playing the game of same prices on the radios with much less qaulity

Heh.. well i agree its a crappier (is that really a workd? lol) radio
just like almost every Ranger/RCI, Galaxy radios heh.. Galaxy used to make a
decent radio.. Never really liked RCI but they did put out some decent radio's in
the past.. but now they all suck.. Pretty much anything that comes out of
Maylasia (sp?). They have much cheaper parts, boards and the quality of radio
isnt where it used to be or should be. I have 2 old R.O.C 148's and a older
grant XL and love them plus an older phillipines 148.. But i've own almost every
Galaxy radio made, all crap except for the older non maylasia nodels.. I stick
with the older radio's, i've been out of the radio end of things now for about a
year but im getting back into it.. i figure i'll try out a president george or
something like that out and see what i think of them .. BTW, i have another 148
that needs a faceplate, knobs and a bottom cover.. Prefer them to be in good
condition, doesnt have to be MINT but as close as possible.. i would like to be
able to read the faceplate and possibly see at least a partial refelction in it
hehe..

David

Sharon:

Interesting theory... How do you explain the signal's presence in states such as Nebraska, Oklahoma,
Michigan, Ohio, Kentucky, or Colorado?

Oh, and I didn't know ships sailed in belly-buttons (navels).. If you're referring to the Navy, it's
Naval.

Just my two cents.

-CGP

Don:

Actually, if you compare the board layouts, the ST and the old GTL are ALMOST the same radio.
Compare the components and you'll find that the ST is cheaper. The ST inserts its little sub-board in the audio amp circuitry, and that's really about the only difference.. Cheap components, and unnecessary electronics.

2950's and 2970's don't last long in the Big Trucks, and being a truck driver myself, I hear alot
about "those cheap a$$ piece of $h1t RCI's"... Radios (and drivers) in trucks take alot more
abuse than they do in a Suburban or a Caprice Classic... Think about it.

As Forrest Gump said... "That's about all I have to say about that."

Probably talking about a variable carrier power control.. Remove VR10 and run wires to a pot you
install on the bottom or back of the case, or the SWR CAL knob (with some other mods) I saw once.
::shrug:: Simple mod to do, really.

SSB doesn't transmit a "carrier", so simply keying the mic won't show any wattage. SSB is ALL modulation, from 0 to whatever the radio will do. Try saying "Four" into the mic and watch the needle dance.. Hold the O long to see your rough peak output. Oh, and use a decent PEP meter, too. Avg reading wattmeters won't show anywhere near true output for sideband.

>damaged
>long ago.
Over 20 years and names get turned around somewhat. Hy_gain made the
Golden Penetrator with four, horizontal 1/4 wave radials. Yes, the gold
colour was produced by anodising or is it called passivate!

They also produced the CLR-11, which from memory was natural aluminium
colour and had only three 1/4 horizontal radials.

I cannot remember whether the CLR-11 was a 1/2 wave or a 5/8. I know
someone can confirm this and any other points as these antennas were,
I'm sure sold in far greater numbers in the US than here in the UK.

I don't hold out much hope for you in finding what you want. If you want
a 'classic' design 5/8 omni you could consider one of Sirio's though I'm
not sure if the UK importer carries their full line.

You may just have to get a cheap flight across to mainland Europe.

sounds like you have alot of rf floating around in the
shack....quite often this will cause the switching transistors
to conduct even after the key is released..... good grounding
is the answer. ground everything to a common wire and then to
a ground rod. (deep) if that don't work then start removing
things, like watt meters, amps, and things like that. see
which one of them makes it stop. if it still does it then start
checking coax shields, make sure you have good solder
connections....something is not grounded somewhere...

Hello Phil & CH: Here's what I know about the "Golden Penetrator"

The first 5/8 wavelength CB Base Station Antenna, produced by Hy-Gain was called a "Golden CLR" or "Golden Penetrator". This was model number Order 514. The Hy-Gain advertisement people may have gotten a few of the antenna names a little mixed up. Because the advertisements in the old CB Magazines have called the first antenna a few different names. The first 5/8 antenna was not a true 5/8 wavelength long, but was shorten to not exceed 20 feet, as Hy-Gain interpreted this as a FCC rule. These first 5/8 wavelength antennas suffered from mechanical stress problems, in high winds.

The CLRII was a improved two point mechanical support method, that significantly increased the mechanical support, to bullet proof mode. But was plagued with problems being burned out by CB'ers using to much power. The two small impedance matching coils in the bottom insulator could not take the fire in the wire, that the CB'ers were sending in the early to mid 1960's! The CLR II, had three top hat wires, and three ground radials.
And was a true 5/8 wavelength in height.

Hy-Gain then came out with the Penetrator 500, model Order No. 500. Some were in the late 1960's. This latest and greatest 5/8 Wavelength CB Base Antenna, had a inductive impedance matching system made of #12 gauge wire, that came advertised from Hy-Gain as being able to handle 1500 watts! I am sure the Hy-Gain design engineer's said let try to burn this one up! This new antenna has been called "Super CLR", "Penetrator" "Super Penetrator", "Golden Penetrator", and maybe a few more names that I haven't heard yet. But the advertisements did use different names, making it a little difficult to keep straight.

And if anybody's got a old original "Golden CLR" antenna or just a copy of the assembly instructions, Order #514, I'd be more that happy to buy it.

First you have to find out what reference the antenna
manufacture is using for DB gain.
Over an "Isotropic antenna"... big numbers that mean little
in reality, over an "Half wave dipole" Getting more
realistic or over a "single element yagi"... you will get
smaller numbers but they will accurate in reality
Cheers,
John.

a lot of these cowboys use glocks now, and then they go to the gun
store somewhere who caters to cops and then they get their triggers
fixed so they are hair triggers. then you wonder why four guys can pump
out that many shots at one time. sounds to me like they overreacted. of
course when you got four overeager good buddies with their guns drawn
and pointing at you , the last think i am going to do is reach for
something in my coat, i am going to freeze and do what they say and
that is my roger,.......cd is out.......

Bill,

Hot sellers for handheld cb radios are the Maxon WTA-1 telescopic
antenna @ $12.99 and the Cherokee extended range antenna @ $14.99

HAMFEST March 5, 2000 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - March 5, 2000

On March 5, 2000 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest. The location will be at the:

Knights of Columbus
400 South Broadway
Lindenhurst, Long Island, NY

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes. General admission is $6.00.
Free Admission for spouses and children under 12.

VE - ARRL - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam session. 1999 ARRL/VEC fee is $ 6.45, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

PLEASE NOTE: The VE session will be held at the Babylon Town EOC.
200 E Sunrise HWY, North Lindenhurst, NY.

Vendor information - Walter Wenzel KA2RGI at (631)957-0218.
Email info@gsbarc.org

Talk-in will be via W2GSB Repeater on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

> hi , will a heathkit sb 220 with soft key work with yaesu 840. thanks

Yes the SB-220 will work superbly with the FT-840. Make sure you
connect and ALC line between the radio and the amp in order for the
speech processor in the FT-840 to function properly. You can wire both
so either a footswitch can be used to key the amp or a direct relay
connection that allows the radio (FT-840) to key the amp. Good luck.

> IT'll work fine.

I completely agree with AB7RS. As long as you dont push the D-104 too hard into the speech processor on AM. The MD-100 mic is excellent on SSB where the D-104 has alittle too much high end for SSB use on the that particular radio.

Hehee! Well I hope it helped some! A friend of mine was telling me
that 60 out of a lincoln is stretching it out a little since the
traces inside of the radio wont handle too much. There is always a way
to beef up those traces so they will handle full power.

The 146's are very good for all around use. I had a few myself and
they rate up there with the 148's except for the expanding of
frequencies. Only reason I dont have them now is, I dont hold on to
any radio for too long. Im about due to get rid of this 148 that looks
like a DX version.

From: cobrano-spam@budweiser.com
Message-ID: <38b8294d.2392765@news.thegrid.net>
Source record: 25043

Much like below, The on glass 2 meter will work OK but not as good as
a mag mount or a perm mount antenna. Most of the glass mount antennas
I seen show some gain but in reality they have no gain what so ever.
Best thing would be to get the permanent "NMO" mount and put it in the
roof. If you use a quarter wave whip for 2 meters, it will look like a
businesss band antenna or you can get one that will mount the same way
that looks like a cell phone antenna.

BULL,large metal surfaces including long random length wires are for
ground-mounted verticals.For above ground verts resonant radials are
needed and work VERY well.I have 2 of these now,12 and 17 meters.You
think if I lose my 1/4 wave radials and kook the radiator to a cast iron
bathtub I'll get out better?
Also,resonant radials are not called "ground planes".

Okie dokie fellow CBers!

I went out and bought me a new Uniden Washington base radio yesterday and am really enjoying it.

One of the "tricks" a local fellow CBer told me about was the "hidden channel 44" trick.

I would like any information with regards as to how to go about "turning up" the radio so that I can get more audio/signal output from it.

And if anyone else has or knows of any other mods that can be done to this radio, please let me know.

Hello Tracy: Was that you on 3950 LSB and 14313 USB the other day or
was that someone else using your call sign? Good audio quality with all
the animal sounds.

Jay in the Mojave

If you think 101 Charlie in the port-a-potty is bad, be thankful that Frank Burns and the rest of the Phoenix Idiots on 36 LSB are gone. Ol' Frank died about a year ago, and his death ended the long standing feud between Frank and Howard Lance Kingston. 11 meters has been much cleaner and much more enjoyable since Frank's death. Now if there was just some way to get rid of 101 Charlie . . . .

73,
David

Here is a clarifier mod for it:
http://www.qsl.net/kf6foz/main.htm
go to the CB page then to the very bottom.
More will be added as I find.

First of all, This Maverick 250 you speak of, is NOT transistorized (3 pill). It IS, in fact, a TUBE unit..(4 driving 4)...I believe the tubes are 6LQ6's (if im not mistaken).

I know a guy that has one with 80% tubes, driving it with a Uniden Washington base (4w~deadkey, swinging approx.~16w). It does fairly well with a 170w~deadkey,and 620w with normal speech tone (it will do 675w on a high-pitched whistle). into a Solarcon Antron 99 about 50' up. unless you have 8 pills in your vehicle, you ain't talkin' !! Imagine what this thing would do on a JoGunn Flat 6 or 8?? Unstoppable!!

Watergate rollin is about keydown vehicles. What kinda watergates you want? hell the only watergates I got are of keydowns, the only way to get them is to win the class. I don't think it would be good to put a bunch of watergates of us on the site, kinda conceded to me. As far as getting my name called. If I do get out there, which I don't very often, I have no problem holding my own, I can tell you this, what you got could not stop me from talking. It is rare that someone does not respond to me when I hit the trigger. You are considered a dickhead on this group, this is all brought on by your own actions.
As far as the prices of the amps being on the www.davemade.com site, I don't think that matters, those guys have got the market, people will pay for them regardless of the price. They are good amps, there is no need in you hugging so hard, you are just like everyone else running Dave's stuff, or any other good equipment. You are simply paying for technology, you have nothing to do with how good they work. People like you come a dime a dozen, they see something work better than the older stuff they were running and at that point assume it is the best, well the best it may be. You have never seen any of the amps from down here run so you don't have a clue of what the best is. If you were into keydowns and someone showed you an amp that out performed what you were currently running you would probably be the same way you were when you went from Texas star to Dave made, hell at the time you were running the before the Dave amps you probably thought that they were the shit, then someone show you a Dave and you changed your whole outlook, don't be so centered, be more open. All your doing is making your self look like a nut hugger, believe in what you yourself can do, not what you can pay for. There is nothing wrong with the amps you prefer, but don't make it sound impossible without them.

Source record: 25066

The same thing happened to me with my Uniden grant XL....The 3 position knob was out of the bottom though...I also bought mine used. What you have installed in there is an EXPO B model channel expander kit, it is designed to give you 40 lower channels (left position), the regular 40 (center), and 40 uppers (right position).....The problem with this 'channel kit' is that it "drifts" off of frequency (especially if the clarifier is open) The 148 GTL, and the Grant XL have the 8719 PLL chip, and can be converted off of the circuit board..I had mine COMPLETELY redone this way (20 lowers, 80 uppers), and had a Galaxy FC347 --6 digit frequency counter hardwired, and mounted on top. WORKS GREAT!!......My advice is, take it to a shop you trust, and let them align the radio, as best they can, along with making you up a frequency 'road map'........

I have a GOLDEN Penatrator 525 BRAND NEW in the box. Not for sale. Will put up in the future. Same as 500 model but gold, touched by "Goldfinger" of the 007 series. Yes, they probably had former truck driver Sean Connery at the end of the Golden line touching all that were made in those days, before Rodger Moore took up the slack! Best Base antenna ever made. I'll tell sad story one of these days as to what happened to all the parts for these when someone wants to hear it.
Dave!!!

I was wondering if anyone out there was running a newer model Suburban for shoot outs. I was told that you could not becouse of the computer. Then I was told that someone saw some new models at a shoot out in Atlanta. Can anyone set the record straight. If anyone out the has one or knows someone who is running a newer model please let me know.
Thanks.

Um - ever hear of propagation or skip?

On a seperate note (for another fella), sonars operate in the rgion of approximately 5 kHz to 30 kHz - not MHz so you would not be getting radio interference as these frquencies are in the portion that you can hear with your ears. If you doubt me go to sea on a ship operating sonar and you can hear it - particularly if you are below the waterline.
Also the same with the shipbourne radars, they wouldn't be causing you interference. The lowest frequency that shipbourne radars generally use are in the "Delta" band which is around about 450 MHz and due to the potential of interterence with airport radars they will not usually run them when they are within 12 nautical miles of an airport and almost never transmit when in port. This would not cause much of a problem with your CB even if they were to transmit!!

Oh also I guess that those navel vessels would have to dodge all those fluff balls in the region of the belly button

I wouldn't have thought so - a jacobs ladder (in the maritime environment
refers to a ladder made of wood and rope that is used carry out maintenance
on the ships side.

I believe a jamming device could be built that way,wouldnt

1) FRENCH PART :

Bonsoir toutes et tous,

Ce message sort un peu des messages conventionnels
relatif aux contacts ou au dx et j'esp re que personne ne
m'en tiendra rigueur.
Dans le cadre d'une conception de carnet de trafic
informatis TRES complet, je suis la recherche
d'informations relatives au :

- Calcul de "ligne grise" c'est dire heure de lever/couch
du soleil en fonction du jour/mois et latitude/longitude.

- Protocol de communication & fonction ICOM et YAESU.

Merci de bien vouloir me contacter via e-mail perso.

ENGLISH PART :

2) Good evening,

The subjet of this mail is not realy like others where we
talk about radio contact, but I hope that most of you
will read it and will help me.
In the goal to build performent logbook on computer,
I am looking for information about :

- How to calculate the "gray line" with the time of
sunset/sunspot for a day/month at a latitude/longitude.

- ICOM & YAESU communication protocols and fonctions.

Thanks to contact me via personal e-mail.

Q32 is NOT for more modulation it is for your RF power output if you want to have more modulation clip the resistor that is to the left of VR14 that is not marked.

>take place?

here's an idea if you live in a small town.
get everyone in town to get off the radio for about 2 weeks.
have EVERYONE in town complain to the FCC about interference for the preceding
2 weeks.

do this about 4 times a year. the FCC will think you live in a radio quiet zone
and all the complaints are crank calls.

eventually, in a year or two, they will stop coming altogether while thinking
that everyone is crying wolf.

or, you could try bribing the local field engineer. if you do this, bring
plenty of money to get his attention the first time or you'll get busted for
bribing a federal official.

good night. :)
Jeff

>CB is legal. Certain activities with a CB are illegal, so I (and I'm
>sure most hams that operate on CB) simply avoid those activities.
>

the only problem that exists here is the hams that won't avoid OTHER peoples activities on this ng when they ask cb / out-band related questions.

i remember a time not too long ago when a certain group of hams would go around this ng slamming people who asked questions about the shadier side of cb.
here was a perfect opportunity for those hams to "avoid" these activities but, instead, they would get VERY involved in them and just stir up a whole bunch of shit here.

on the other side of the coin, there were a lot of hams who took a "live and let live" approach to this subject and would not comment on such posts but, at the same time, would be helpful to the people who asked questions about "legal" cb problems.

there were a lot of the negative hams who wouldn't help ANYONE. just bitch about the "evil" ones.
these were the completely usless ones that smeared the reputation of the rest of the ham community on this ng.
this is where he probably got the impression that he has developed about the hams here.

i agree. i have read a lot of the posts on the other "deticated" ham groups.
they, for the most part, are pretty boring.
i think they come over here to get their blood pressure back up to normal so
they can stay awake when they go back to the ham ng's. :)

define "legal" or is this the trade marked name for your product.

i don't think your definition of "legal" and that of the cable companies or the laws that protect them from theft of service are quite in phase.

i have checked the "send via e-mail" box on this screen. when i click "send", i'd be willing to bet a months pay that, before i finish reading the next post, i get a postmaster notice that your e-mail address is undeliverable.

if your product is so "legal", why are you so scared to use a valid e-mail address?

your post stunk so bad that i could smell it when i signed on.
why don't you go post it on rec.radio.bullshit where it will be listed just above plain water cold fusion.

:> Good God! Someone is using a Antron 99 as a standard to base all antennas. A Quarter wave antenna
:> should never be used to compair with a 5/8 wave antenna. Maybe just for radiation patterns.

On the contrary, it is a valid reference.

A 1/4 wave antenna has a vertical maximum radiation angle of about 30 degrees above the horizon - even with ground radials.

A 5/8 wave antenna has a vertical max angle of about 15-20 degrees - making it better for long range communication.

2482. TELL ME WHAT THIS IS!!

Newsgroup: rec.radio.cb
Date: 2000-02-27 00:00:00 UTC
From: Goliath000@webtv.net
Message-ID: <29848-38B9DA47-75@storefull-278.iap.bryant.webtv.net>
Source record: 25101

Ok while tresure hunting in the local junk store I came across this some
kind of Radio, C.B., Ham Radio, or some thing I dont know. It says
Hammerlund on it,
It has a off, rec, send, q mult-cw switch
Antenna adjustment dial
Main tuning dial
sensitivity dial
Main, Avc switch
Tuning Range Mcs switch, 20 bs, 10-30, 4-10, 1.6-4, .55-1.6,
Off, lim on swtch
Audio Gain dial
Band spread dial
selectivity dial
Freq. dial
Carrier level gauge
and it has two gauges that have all kind of numbers
ON THE BACK
3.2 ohms speaker hook up
Phones hook up
Meter zero adjustment knob

If any one can tell me about this or where I can find out about it, I
would be very thank full.

Mark

This is a very common problem with the 2000.Locate D528(xzo57) in the
freq.counter module. This is a 5.7 volt 1/2 watt zener diode. Replace
with an NTE-136A 1 watt. This will normally solve your problem.
Good Luck
Hacksaw

Yeah hamm4fun, it IS that bad.....
I work 3:30 to midight, and usually get home to talk on the radio about 12:45..
by then ALL the truckstops around me are filled to capacity, and you can usually count on a "Radio Rambo" trucker arguement on a nightly basis. My guess is they are running those 225 amps that bleed ALL over the band...
(i'm not saying the other amps don't bleed, but those 225 amps are REAL dirty units.)

Do you think a JoGunn 'cross' (horizontal/vertical) beam would work?? Would it have the same side-to-side rejection on the vertical side?? I'm hoping I can come up with a solution, I'm SICK and tired of them plugging my ears from 20 channels away!!!!

.And for the tower, What brand and type would work for a 6 element cross?? i hav been told the Rohn HDBX 48' won't work for this application...
.....Thanks for any help..

I apologize for the mistake, but i was judging from the lowest frequency being 26.8150, and the highest being 28.0450.
But you are correct, there ARE 'breaks',
or skipped channels, if you will... To get the "A" channels, I would NOT recommend opening the clarifier, unless you have 6 digit frequency counter (for both transmit AND recieve)...I have a 10KHZ switch, that bumps the radio DOWN a channel (instead of up)... NEVER a problem!!

Once again, MC 10KW jesus, I apologize for the mistake....

Darn dude, what is your problem? AB7RS asked why hams are posting to
this newsgroup. Superstar responded by asking AB7RS why he was posting
to this newsgroup, and then said that hams were probably posting here
for the same reasons.

Now, how in the heck do you see that as an attempt to "belittle"
someone? What the heck did Superstar ever do to you to justify this tirade.

Talk about a person with a chip on his shoulder.

Hell Dave & Debby: Good deal, that's another key to the puzzle, I didn't know if Hy-Gain had a different part number for the gold anodized "Golden Penetrator" or not. I have a old used Penetrator 500 that you can see the gold anodized surface in the parts not exposed. The weather and time as has faded the gold anodizing. But the antenna works just great.

I would be happy to pay for the photo coping, time, and shipping charges for a copy of the assembly instructions, for Order No. 524 the "Golden Penetrator"

Same goes for the "Golden CLR" made back in the early 1960's. its Order No. 514. It has a insulated base that holds the bottom vertical base element, and has the tuning wire going up and down the vertical element from the base insulator, for about 3 feet, that has three support brackets holding it in place. The Hy-Gain "Golder CLR" looked like the GC Electronics, or later Hustler 5/8 "Antler" CB Base Antennas.

Let me know, and thanks for the missing key to the puzzle.

: I wouldn't have thought so - a jacobs ladder (in the maritime environment
: refers to a ladder made of wood and rope that is used carry out maintenance
: on the ships side.

In electricity, a Jacob's Ladder is just a type of repeating spark gap.
As such, it does not generate a narrow band of frequencies - but is very
broad banded. Any interference it produced would not move through the
band, but be present everywhere in it at once.

: it's kept shut. Granted it is your opinion, and yes you are entitled to it.

You don't have to be good - just lucky and well promoted.

Granted, a few probably are decent musicians. But they don't seem to ever demonstrate their ability. It would probably destroy them in the eyes of their fans.

I have run the sound board for quite a number of musicians and groups. I have seen talent, and I have seen popular groups who don't even bother to tune their guitars.

I am afraid that, these days, actual ability often has little to do with how much a person/group is paid for performing.

whats up with the name calling?(mudduck), i
i asked a simple question and get called a mudduck? here is what my
notes say that i got off the net:
tune up modifications

adjust vr14(amc) for maximum forward modulation. mod limiter q32 can be
removed for more modulation, but it all so disables vr12(ssb alc) and
disables variable power for ssb. i do not recommend removing q32; you`ll
have plenty of modulation as is.

i expected better from a fellow ham,73 de irondogg
and for the rest of the groupe thank you for you sugustions.

> They do make a SSB head for that mike.

Yes they do, however, the Astatic low frequency mic cant hold a candle to a Yaesu MD-100 microphone on SSB. If you compare the two on a scope you'll see a dramatic difference. On sideband, crystals mics are not where its at, which even the Astatic SSB mic head still has a crystal actuator.

mark my words here, there are those who are going to try and use this against the present mayor of that city , to try and harm his efforts at running for the senate. also i believe hillary will try to use this against him also. when you take this for what it is , a terrible accident, people like this sharpton character could care less about the guy who got killed . sharpton is just using it as a way to perpetuate his power . anybody know what this guy does for a living or when the last time he got up early and went and hit a lick. he calls himself a reverend, give me a break. he is a joke and he has been doing what he can to stir the pot for a long time. don't worry about the guy's wife. she will come out smelling like a rose on this deal after all the law suits are settled . in some macabre way, it has to be said that in death, she will get more out of her husband than she ever could have hoped to get while he was alive. she will definitely be moving on up to the east side. and so it goes. like the boxing manager don king, says , 'only in america'. ,....cd is out...

> successfully, I really don't want to do it then......
>
> Thanks for the help......
The main advantage to a horizontal beam would be much stronger signals
both ways when talking long distance(over 50 miles and skip).Also
ability to work weaker sigs due to less noise.The rejection would null
the truckers SOME but the locals on verts would be attenuated due to
cross polarization.Some beams are vertical and some are both or
switchable.You can get a rotor that will flip and spin the antenna.
The HDBX is the cheapest free standing tower but boom lengths must not
exeed 10',thats pretty small!
All said I wouldn't be without a beam but don't think it will do what
you want,look into filters.

----> Equipment For Sale <------

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition-
with copy of manual $250.00 (Pending Sale)

RT-524 30-76 Mhz Military FM transceiver, Good condition an 8 on a 1-10 scale,
No nomenclature tag (desirable for collectors) Replaced with Serial Tag.
Manuals and original mic. $500.00

Swan 1200W 10-80 Meter Amplifier, Very Clean Condition, Uses 4 6LQ6 Tubes
With Manual. $250.00 Pic will be on the WebSite Soon!

Yaesu XF-32A SSB filter for FT101 series, $40.00

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced!

Commercial VHF Handhelds:
Motorola Radius P50
Kenwood TK240 with drop in charger
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $130.00 Reduced to $100.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00 (Pending Sale)

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and
D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required $150.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics
Mere, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

Alan K1313 10 meter Single Tube Modulator With Spare 6KG6 tube, New Russian
tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs
right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a
Demco Tube Modulator. Smooth Clear Audio! $200.00

Misc, Yaesu FT101 Components and parts, Misc untested boards Email If you need
something.

Electrovoice Mic.... See Website!

Misc 19" Racks..... Email for Details

Will Trade For Mustang 5.0 Parts!

This kinda reminds me of what a truck driver said about NYC law recently. He basically said that (my interjections here) because of the wickedness of the LAWYERS & Judges, the cops have learned to circumvent their wicked communist law systems. What they tell truck drivers that IF someone messes with you, (now this really is colder than NYC ICE COLD ICE), KILL them & make sure they are dead (less paperwork for cops). If someone jumps on your truck @ a red light, hit the air horn & GO through the red light ! If you injure someone that is trying to rob you, then make sure they are dead & the cops ask NO questions! Who created this lawless mess? The LAWYERS & the Judges, that's who!
I only report what drivers from there tell me! Is it true? Let me know!!!!
Dave!!!

What's the matter can't your station get out of Billings, Montana OM or are you just down here beating your finger tips instead of your gums again. Like I said try putting a few good hours of your week towards building some lowly chicken bander into a good operator to suck into your amateur ranks and quit trying to belittle everyone. Some Extra Class(where's the Extra in Extra in your case) operator, you are suppose to be the top of the heap and you keep come down on us because we enjoy our little slot (also the one that your service lost from inactivity I might add), go get on your radio and try to hold onto the freqs you are going to lose to some appliance operator that's getting his ticket as we speak. GO AWAY FOOL! I'm fixing to sign off this ng and do some illi-gal DXing myself. As I'm not one of your kind, I like people on the air even the fools as they keep nuts like you gathered up into a pile called HF,VHF,UHF.....!
Go police your own ng's like you probably do the air-waves around Billings,MT Mr. Tracy E. Glenn and the Mr. is up for question as you sometimes sound very childish.....!

I just sold a turbo 667v that was six months old for $260. Unfortunately, most people will only pay 50% of new. OBTW, that amp will not do 900+W, even if you are referring to PEP, no way no how. Most people can only measure average power anyway since most meters are only average reading meters. With an average reading meter you should see between 300 to 4000W out of that amp depending on how hard you drive it. At 400W average and in AM mode, you will have modulation compression so I would only drive it hard enough to get 300W average with a normal symmetrical modulation envelope. Just thought you should know.

John

Dont know if you will really find a website that goes into great
detail, but asking here is the best place for answers.

There is the question as to what features you want on the cb.
Distance does matter and the size or type of antenna will make a
difference.
Also do you want it to be a permanent installation?

You can get hand held radios, but in a vehicle they tend to be a
little bit of trouble operating.

For size and portability, I used a Uniden Pro 510-XL with a Wilson
1000 magnet mount antenna. I had a cigarette lighter plug attached to
the Radio that way I could just remove it at will and had velcro
underneath the dash to quicly apply the radio and never had a problem
with it. You could also just shove the radio between the seats but
that would also muffle the speaker.

Hope this helps some. If not just remove "no-spam" from my e-mail
address to reply for more info

Sincerely,
John Johnson

What is spam if it's not in a sandwich or minced in scabbled eggs.SPAM!
What does any of the stuff I saw on the site protain to CB especially
the links to porn. Calling someone a dickhead in your case might be kind
of flattering. Oh, by the way I got a warning message that one route
wasn't finished. Kind of like the one to your head, dick! And yes I use
more than enough to be hear in the form of the type of equipment that
you mentioned. As I got tired of flushing $$$$$$ down the drain on CB
equipment in '81, SO? If a operator can't run with the big dog of the
block he might be suggested to keep his _ss parked on the porch. Flame
this Richard.

Were there ever any tube type radios that used the 12 or 14 crystal osc circuits? This is to settle an argument. I don't think there are/were any but my friend says he remembers one but does not remember the name. A couple of his buds say they remember one also but very convinently can't remember the name either.

Hi Anon,

Re: your subjects 'I sell refurbished radios' and 'Me too'

Funny! Funy! Funny!

It has been a thirteen year tradition for Palco Electronics to sell only factory new merchandise.

There is nothing bothering Tony night and day at Palco Electronics, however apparently Tony is bothering someone night and day such as the author of the above subjects!

By the way Mr.Author the supposed e-mail addresses above for and from both Copper Electronics and Palco Electronics are one and the same, and neither one belongs to Copper Electronics or Palco Electronics!

Funny! Funny! Funny!

Regards,

Tony

The antenna is not going to help your problem nor are filters. Is the interference from the truck stops really that bad? I do a lot of traveling and usually find there is not that much radio activity at truck stops.

2538. For Sale. Emperor TS-5010 & TS-5011 matching power supply

Newsgroup: rec.radio.cb

Emperor ts50-10 am-fm -cw usb-lsb variable power. 10 watts + am 40+
ssb.Coverage is 26.500 to 32.000. You can check power, mod, swr . Bright and
dim ,up-down channel changing,Very nice radio, i would rate a 9+ never been
moble. Was used as a base 1 owner. Comes with box,power cord, original mike,
and a full tec support manual,never used.
Emperor ts50-11 matching power supply, with speaker. &
base mounting brackets. I would rate this a 9+ also. everything is in excellant
condition, I would take 200.00 + 10.00 shipping. for the pair.

Well, what do you think? Any of you CB shops out there that mainly work for truckers notice any loss in business yet, or is it only affecting CB shops in the Northeast?

Or will this do what it did in '73--increase auto CB sales looking for cheap gas? Or have things changed, as Ingvol says?
Dave

I put a 900 mhz base antenna in to a cordless phone, & wired the RG-59 that came with it RIGHT INTO the unit itself, no connectors. It worked better than just touching the center wire to the antenna! I did many 46/49 antenna installs in the past, but this was my 1st 900 freq. antenna, made for a cordless phone, 40' coax, I think.

If you just want to talk vehicle to vehicle you might want to consider
a couple of 'Family Radio Service' radios. The cost is about the
same as a CB and you don't have to put up with the bad language
and rotten operating practices.

Your friend is correct. There were many 12 crystal tranceivers. The
Tram D-201 is only first one that immediately comes to my mind, in
addition to a couple of Lafayettes.

That mod cost me 30 bucks. Sounds like a lot, but he mods lots, lots and lots of radios and people(like me) keep paying it.

Why would you want to mess with that small of a amp? If you are going to run power leads and jumpers for a external amp it might as well be worth it.

So far fuel has been under$1.50 per gal. out here in WA.,to darned high,were supposed to finally get a subsdy,on the loads, rumer has it its gonna stay up all year,and yes it has hurt a lot of owner operators like myself! I still see the company drivers with cards fueling at the high priced joints, between it and keeping my beloved KW, on the road,its really cut into my pocket book, and radio buying.

mickey <mickeyNOmiSPAM@mickeys.co.uk.invalid> wrote:

Well you see manufactures work this way. They know that joe public looks for bigger numbers. Let
me put it into perpective like this. You go to a car audio shop. They have two amps that you are
interested in. Amp A. is a 4 channel amp. with 50 watts per channel, and cost $429.95. Amp B. is
a 4 channel amp. with 150 watts per channel and cost $159.95. Which one are you gonna buy? The
one with a higher wattage rating, thats cheaper? Problem is is that 4x150 Watt amp probably
outputs that wattage at a ridiculous high harmonic distortion level that is not eve usable for
car speakers. The 4x50 Watt amp is probably conservativly rated and produces higher wattage but
they have a accredited standard that they use to measure the usable power for a speaker.

A lot of companies use these tactics to get your money cause they know that most consumers look
for the bigger numbers.

Hi.

Don't deal with PreacherKy@aol.com AKA "John"

Last December, he promised to buy a Cobra 2000 from me, lied to me three times about the money order being in the mail (I only wanted $180 for the old radio.)

I turned a few people away, because I had given my word to John. He repaid me with non-performance, Lies, and a couple of time-consuming long distance phone calls.

I'm not angry, & I'm not Bitchin. It's no big deal one way or the other. But if You deal with this guy,just take his promises with a grain of salt, and Don't bet the Farm on it!

The radio is still for sale.

Andy

>a popular model because they are hard to break. It is not a CB.

Okay, here's a TS-830 question for the group:

I own an 830 which has an unusual modification for CB. There is a switch on the rear apron which will put the radio onto the CB band. With the switch the other way, it operates on the ham bands.

I have studied the wiring done by the previous owner, but the guy was so good that it is hard to tell where the factory wiring ends and the modification begins.

The radio works and sounds great on CB (USB and LSB only, of course). And it's still great on the ham bands. In fact, the receiver sounds better than a FT-890 sitting beside it.

The only problem is that the WARC bands are receive only, and the factory mod to restore them does not work. I am confident this is related to the CB mod.

I want to sell the radio, but hams want the WARC bands included, rather than the CB. Anyone know how to reverse this particular modification?

QRM

I think the CH44 trick he was referring to is when you push the CH9 button in part way. If you do this properly the channel display dissapears but the CH9 LED does not come on - the only drawback with this trick is that you have to hold the button just right or else it goes back to the channel you started on or goes to CH9 if you push the button to far. This trick worked with my uniden grant and I am fairly certain it works with the washington as well.

And the point is? Don't want to sound like a smart-arse, but in response to
another post my comment was that it would NOT be sonar (or radar).

> As for skip, this doesn't explain the noise being heard at night, or after
the
> skip has died for the day...

Just because the "skip has died down for the night" does not mean that the
propagation is finished for the day - have you ever heard DX suddenly come
through and then just as suddenly dissapear?
If the noise is constantly present I would suggest that it is more than
likely the result of industrial or medical equipment. It could even be the
result of welders in the Naval (or even a civilian shipyard - God forbid!),
as they have been known to cause some pretty nasty interference. Hope this
clarifies my initial post.

Old ham band only or shortwave recv'r., depending on the model, should say something along the lines of "HQ-170A" or similar HQ number, these were the most common series. Good rigs, lots of fun to listen to, some a worth a few bucks to collectors, not as much as National and Collins stuff.

it has alot to do with CB. thousands of CB'ers are now moving
to the amateur ranks and adding 2 mtrs to the shack. mighty
handy to have when the 11 mtr band is open and running 40 over 9
with skip. with 2 mtrs you can keep in touch with your buddies

There was an article I saw where a guy made a beam antenna out
of elements hung from ropes stretched between trees. I think it had
something like 20 or more elements. Gain figures were actually
MEASURED well into double digits. Even with the losses to the
pattern from the rope sagging.

Mike

2583. Citizen's Band

Newsgroup: rec.radio.cb
Date: 2000-02-28 00:00:00 UTC
From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <89e3td$318g$1@newssvr04-int.news.prodigy.com>
Source record: 25202

CB stands for "Citizen's Band" and that's exactly what the CB is .....a set of frequencies designated for use by the citizens of the United States. This came about in 1945 after World War II when the Federal Communications Commission, FCC, proposed setting aside certain frequencies for public use.

The FCC is a federal agency that regulates electronic communications such as the radio, TV, phone, the Internet, etc. They chose the lowest frequency spectrum at that time for CB usage leaving the other frequencies for more important uses, (police, military, radio and TV) and because they thought that no long distance communication could occur on thse frequencies.

On 3 July 58 the FCC, (a.k.a. "Uncle Charlie") officially assigned 27 MHz for the use of CB Radio with 23 channels. Back then it was called the Citizen's Radio Service and to talk on it one had to obtain a CB license by filling out a simple form but this step was eventually eliminated. In 1977 the FCC assigned 17 more channels to the CB making it the 40 channels that we use today.

It took off slowly in the beginning but once a CB prototype was developed that was dependable and relatively inexpensive to the general public CB popularity skyrocketed. In the late 70's to early 80's the CB craze was at it's peak but as all fads fade so did the CB but not everyone forgot about it. Still thousands of people depend on it everyday to communicate for work and play and it's so much cheaper to obtain and operate than a phone, pager or celly. The CB has been and will always be a big part of Americana!

>If you just want to talk vehicle to vehicle you might want to consider
>a couple of 'Family Radio Service' radios. The cost is about the
>same as a CB and you don't have to put up with the bad language
>and rotten operating practices.

Unfortunately, this is no longer the case in many areas. As FRS becomes more popular with the "masses", the potential for abuse and problems increases proportionately. On FRS, I'm starting to hear a lot of the same "get the %$#@ off my channel", deliberate interference, etc., that we've come to associate with CB over the years.

When Wal-Mart advertised Ranger FRS radios for $29.99 a few weeks back, you knew it was only a matter of time...

Here in the UK the craze took of in the seventies and eighties
also, unfortunatly over the past few years its popularity seems
to have plummeted. The people that issue the licences say that
every month 800 fewer licences are issued. Maybe we need the
Spice Girls and Brittany Spears to do a remake of *Convoy*!!!

Then we would all be complaining about the amount of traffic on
the air. It would appear this is a no win situation.

Now I have been following this NG for a while and I am extremly impressed with the Americans knowlege of electronics. So just for a bit of fun, here is a real challenge for all of you electronic wizards out there!!!

Your mission is to tell me if it is possible or if there are enough components inside the PC that you are sitting at right now to turn it into a working CB.

The CB does not have to be anything fancy like Franks Galaxy Saturn, but it would have to have at least one working channel AM and one SSB. You may use any part of the PC including the speakers.

Over to you ladies and gentlemen

Hi All,

I would like to apologize to tony at Palco Electronics for my statements that I said in this newsgroup. I shouldn't have spouted like that, Yes, I have heard the things I said in here, but in all honestly, I've never seen the proof... so, Before Tony sues me, I will post this retraction in public.

No tony didn't threaten me... I just felt bad about doing it.

and No. I'm not friends with him, I don't even like him, But I do retract the Statements.

73's to All.

Hi AB7RS and castle222,

Just for the record, the CBS-2100 has not been released yet. I am a distributor/dealer for the Cherokee products and the CBS-2100 will not be in the country for about another month.

You have to talk into the microphone if you are testing SSB output. The reason is that SSB does not generate a carrier at all until it is modulated.

or how about conceding that as American citizens we all have the right,
still havent figured out in my own mind how a government substantiates
controlling the air waves, like who gave them to them,its going to be
interesting to see the attempts that they make on the internet,I think they
will at first use the moral issues such as porn and such to weedle their
money hungry fingers in ,and thow in a bunch of hidden legislation, just
like the e-mail thing, and then draft a bunch of mindless American
sheep,like ham radio,to try and run things,what I do forsee in the FSR, is
at some point someone is going to come out with repeater networks for them,
why else for all the bells and whistle features on the more quality hand
helds,

A 102" whip works good and isn't so persnickity about location as it's
not loaded,the rear bumper works well.
A Wilson 1000 or K-40 on a hood/fender mount works good and looks
better than one on the roof.

I am assuming,that some day the tones will serve more purpose,lets just
think if the manufacters after flooding the market with radio's,come up with
a way to sell monthly repeater services.Of course Tracy its pure
speculation, but time will tell,kind of like the US postal dept, trying to
charge for e-mail, lol,

Well, Sir Tony. If you did read it above. You'll see I simply retracted my statement's that I knew for a fact that you were selling refurbished radios. I did not say sorry for that fact that I thought and still do think you are a poor excuse of a human being. You're a ASSHOLE, you treat your people that work for you, like SHIT. If I'm wrong, Why did Little Henry, Big Henry, and a few others walk out on you a year and a half ago? Why? Cause they were Sick and Tired of your bullshit. You don't talk to people that work for you with any kind of respect, at all... I remember once, I was there working, and his Car Stereo Dept Manager didn't have his side of the store cleaned up to suit Ol' Tony and Tony goes off on this Mad fit, Threating the poor kid, yelling and screaming at him, If that'd been me. I'd kicked his ass on the spot. Ever better, Once a kid brought an amp back that tony sold him, it was blown up, Tony told, tough shit, you blew it up, I don't give your money back, kid got huffy with tony, called him an stupid ass or something, Tony pulls out his gun, waving it around and shit. The kid threatened to get the cops there. Tony then starts kissing his ass and finally gets him another amp. I'll tell you folks, working at tony's shop was like working in a War zone. You didn't know when or where someone was gonna be shot or shot at. and he expected me to sell CB's out of there? and for what he was paying me??? $6.50 an hour. I made more money driving Straight Truck! (10.00 an hour.) and doing less work! and he wonders why I wouldn't solder mic's for him! I know how to do them, but not for $6.50 an hour!!!!!

My point, I don't discourage people from buying there. Just take someone with you who knows alot about CB radio, ect. or you could be taken for a sucker. Point is, he got rid of me becuase I knew more than he did. and I had better contacts than he did. and he couldn't handle it.

Period. End of Story.

OK, just off the top of my head, for starters, there's a 300W power
supply. And several 27.xxx mHz crystals. If I were really good I could
build a PLL circuit around one of the ICs, there are probably also several
xtal oscillator circuits with 10-14 mHz crystals. More than enough
resistors and caps to build up a tank circuit, if no PLL then definitely a
3 or 4-frequency rig with one xtal per channel. And I know there are
relays, but you got me on the SSB filters. It's been a while since I built
this thing, so I'd have to look. It's definitely possible.

G SEVEN wrote in message <89e3td$318g$1@newssvr04-int.news.prodigy.com>...
CB stands for "Citizen's Band" and that's exactly what the CB is ......a set of frequencies designated for use by the citizens of the United States. This came about in 1945 after World War II when the Federal Communications Commission, FCC, proposed setting aside certain frequencies for public use.

The FCC is a federal agency that regulates electronic communications such as the radio, TV, phone, the Internet, etc. They chose the lowest frequency spectrum at that time for CB usage leaving the other frequencies for more important uses, (police, military, radio and TV) and because they thought that no long distance communication could occur on thse frequencies.

On 3 July 58 the FCC, (a.k.a. "Uncle Charlie") officially assigned 27 MHz for the use of CB Radio with 23 channels. Back then it was called the Citizen's Radio Service and to talk on it one had to obtain a CB license by filling out a simple form but this step was eventually eliminated. In 1977 the FCC assigned 17 more channels to the CB making it the 40 channels that we use today.

It took off slowly in the beginning but once a CB prototype was developed that was dependable and relatively inexpensive to the general public CB popularity skyrocketed. In the late 70's to early 80's the CB craze was at it's peak but as all fads fade so did the CB but not everyone forgot about it. Still thousands of people depend on it everyday to communicate for work and play and it's so much cheaper to obtain and operate than a phone, pager or celly. The CB has been and will always be a big part of Americana!

I seem to have a problem with my co phase coax. Swr on the co phase is 3.7 or 3.9 not a good deal. On a single line of coax the swr is 1.3 to 1.2 real good is there a way to test the coax for impedance "is that the word", to see if there is some kind of fault? What test equipment so I need? Thank you in advance.

thanks, for all that helped me find the problem with antenna, the problem was at the coax conection at antenna ,it needed clean , swr are back to 1:1, I lowered antenna down the inside of tower to work on ,again thanks to all that helped and godbless. craig

2629. Palomar 225 Lemon What To Do ?

Newsgroup: rec.radio.cb
Date: 2000-02-28 00:00:00 UTC
From: Tinker <speed_buggy@hotmail.com>
Message-ID: <89f80o$71o$1@ins21.netins.net>
Source record: 25248

I have a question about Palomar Blue Faced 225 amps . First I buy this 225 from a dealer that says he checks the amps out before that leave his shop. Well I get it hooked up with an all around swr of 1.5 or below on all channels . This time the box may have worked for 5 min. total talk time and it quits and leaves me with no output at all. So I talk to the retailer to whom I bought it from and he says to send it down and he will check it out. Anyway he says that it blew the pills, so he replaces them and I pay him plus shipping. O.k. so now I get it home and check everything out thoroughly and get my swr set to around 1.5 again all around . Well I go to try it out and I talk to my buddy on the way home fom work for about 3-5 min. and it quits again. So I call the retail AGAIN and he says to send it down and he will check it out. Well this time he says that it will cost $70 to fix it so I say to send it back. This was back in August and it just finally arrives last Friday .
Anyway , does anyone know the problem that could be happening here, I and my friends have been running all types of radios for years and are very disappointed with this palomar and do not know how any manufacturer/retailer could sell mechandise that doesn't have some type of warranty. Isn't there a federal NO Lemon law ? Or does Palomar have a ph. # that I could discuss this with ?
So what does everyone else do in an instance like this , when it IS NOT your fault and you are 99.9% sure that you were sold a faulty unit in the very beginning ?
Thanks,
Tinker

BTW I have had other 225's that worked like a champ and didn't have any problems with them.

An inverted v may not work better,especially not for skip.Dropping the
ends enough will add a vertical component doing away with cross
polorization when talking to locals with verts.Drop the ends to any
angle and watch the SWR because it will go up and down,the resonant freq
will stay the same but the impedance will change.

Well, I *think* there might be a suitable audio IC on my sound card, but I think you're right: I don't recall seeing final and driver transistors. There are some inductors in here somewhere, but a proper oscillator and mixer could be a problem in addition to the final amplifier stage.

If the SWR on a single line of 50 ohm coax reads 1.3:1 expect the SWR at the input of the cophase harness to be about 1.5:1 if everything is OK. Don't worry about the SWR on the harness. to check the harness dummy load both sides of the harness and check the SWR at the input to the harness. It should be 1:1 or real close to it.

Anyway I have this dipole in the attic, strung hoz. Seems to work ok, but I have heard that an "inverted V" is a better placement. If that is the case, then at what angle do I set it for....45 degrees on the legs??? By the way this thing works pretty good for an indoor. SWR is 1.2:1

2647. Re: Where to put antenna on truck, etc.?

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: John <mrbreezej@netscape.net>
Message-ID: <38BB30FD.9399E34D@netscape.net>
Source record: 25266

Best result is to place a 102" whip in the center of the cab roof. But, that isn't practical. So, buy a good base-loaded antenna and place it in the center of the truck cab roof. That will give you the best propagation pattern and lowest SWR. Don't place the antenna any where else if you are going to run any power.

2649. Re: what is a dummy load

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: Billy Bob <MYME@T.com>
Message-ID: <rzGu4.4978$kO5.19640@typhoon.tampabay.rr.com>
Source record: 25268

A dummy load is basically just a 50-ohm resistor that simulates an antenna without actually transmitting a signal. It allows one to test the power output of a transmitter, without broadcasting on the air, and annoying the neighbors or the other people on frequency. They can be purchased at Radio Shack for low power applications(15watts or less) or at amateur radio suppliers or CB supply oulets for larger applications of 1kw or more. The small ones are about $15, and the large ones, the size of a gallon paint can, are about $25.

Source record: 25270

The whole question is revealed! I don't have a reference available to me at this time, but in my experience with inverted vee antennas, one needs to keep the angle ABOVE 90 degrees or else the legs interact with each other and give you high SWR. I found that 110-120 degrees worked very well on 40 meters, less than 110 degrees I started losing bandwidth on the antenna. Your polarization will be more vertical with an almost omnidirectional signal, but any directionality will be in the direction the wires are pointing this time, versus perpendicular to the wire on the flat dipole.

Source record: 25274

I just bought a new truck also, and I am a bit leery of drilling holes in it, so I opted for the truck tool box mounted 102 inch whip. The only thing to make sure of is that the box is connected metal-to-metal to the truck body, for groundplane setup. Wilson makes the trucker 5000 with a 22-inch mast if youwant to put that on the tool box. As far as whips go, I prefer the Francis Amazer fiberglass whip, because it doesn't fly around in the wind and stays more vertical. I run mine without a spring and it works great with power.

Be sure you have the tower 'base' which gets cemented in the ground.
Typically, you should dig a hole 3ft.x3ft.x3ft. then set the base in the
hole and fill 'er up with cement. Use a level to make sure it's straight
both vertically and horizontally. I would wait at least 2 weeks to put up
the rest of the tower and antenna.(for curing purposes)

Dummy loads are great,besides tuneing,and the rest of creation not having to listen to somone say audio audio, and whistle,if you have a friend in a close to your station, you can transmit on them , for short range,it is and always has been proper radio manners to tune up on a dummy load,and not over the air waves,no matter what band you run,

Nope. It is a spark gap. As such, the radiated frequencies are (with just
slight exaggeration) from "DC to daylight".

The frequency of peak power may vary somewhat.

Kenwood TS520.

Yaesu XF-32A SSB filter for FT101 series, $40.00

Tram D201 Parts, Wood End Caps, Meters, Crystal/selecter Board, Transformers,
Face Plate, Knobs, crystal filter, Etc... Inquire with your needs,.

Misc. 24V Switching power Supplies, Cosel, Power One Etc... Most new in the box

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00 Obo

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced!

Commercial VHF Handhelds:
Motorola Radius P50 (Weak Battery)
Kenwood TK240 with drop in charger, great battery, great condition.
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $130.00 Reduced to $100.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00 (Pending Sale)

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Icom IC-230 with manual, mic and mobile bracket. not working correctly, VCO unlocks but in great cosmetic condition,, $30.00

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1 Low drive input required $150.00

Yamaha FG-460S-12S, 12 String Guitar, Beautiful guitar, near flawless, Gold hardware, Pearl inlay, Seymore Duncan Acoustic Pick-up, Hard Case $350.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB, Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics Meter, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

Alan K1313 10 meter Single Tube Modulator With Spare 6KG6 tube, New Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a Demco Tube Modulator. Smooth Clear Audio! $200.00 Obo

Pentax K1000 35mm Camera, Wide and normal lens, 2x teleconverter. Cokin filter holder with flare guard. Several special effect Cokin Filters, polorizers and acessories, carrying case etc... $250.00 Obo

SBE Trinidad , 23 channel base CB, near perfect condition, original manual $70.00

Fluke 8050A Digital Desktop Multimeter, AC/Batt, needs new batt. but works great on AC $50.00

NF Circuit Design Block Model CR-116 Low Distortion Signal Generator, $125.00 Obo

Misc, Yaesu FT101 Components and parts, Misc untested boards Email If you need something.

Electrovoice Mic.... See Website!

Misc 19" Racks..... Email for Details

Will Trade For Mustang 5.0 Parts Or Kenwood TS520

To see this Equipment and More equipment and Pics go to:

: The CB does not have to be anything fancy like Franks Galaxy
: Saturn, but it would have to have at least one working channel
: AM and one SSB. You may use any part of the PC including the
: speakers.

Probably, if one of the crystals was on the right frequency.

It would be pretty primative, and you would have to use the monitor
to get the wire necessary to wind your own coils.

Power output might be a problem.

2675. Spacing between horz. beam and ABS 1600 ???

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: lzboyz@aol.com
Message-ID: <20000229090758.18998.00000405@nso-cj.aol.com>
Source record: 25294

Looking for info on the proper spacing between a horizontal beam and an ABS 1600.
I`m going to mount it directly above the beam.
How far should I keep these two antennas apart.(within reason, of course, to keep the inteference between the two antennas to a minimum ?)

Thanx for your help
73
Randy

Add rebar and/or foundation reinforcing metal. Mix the concrete well, then mix it a little bit longer. Add a little cement to each batch if you're using bagged concrete. The A-99 is a great choice-I really like mine.

2681. HOW DO YOU HOOK UP A BASE ANTENNA

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <20000229122900.26497.00002761@ng-cp1.aol.com>
Source record: 25300

I am about to go to a base setup and I know very little about how to do it. I will be using a Maco 5/8, texas star 667V turbo with a 60 amp power supply, and a Galaxy 959 radio.
How do you setup a base antenna? How do you ground it? Ground rod? what kind of coax do I need? I am not going to put my antenna up in the trees, so how do I get the antenna high enough?
Thanks for any info you can give me.

2682. Re: what is a dummy load

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: ssparky <ssparky2@thegrid.net>
Message-ID: <xsTu4.6154$84.806312@alfalfa.thegrid.net>
Source record: 25301

A dummy load is a "big" resistor that you transmit into. You hook it up to your transmitter just like an antenna. It must have a rating in watts as large as the watts output of your transmitter. They are usually 50 ohms resistance. You can make one, but a store bought one is probably better.

Hello everyone !!

With the ease of getting a Ham license, I was condisering updating my mobile rig to something that has both AM and FM. I have been looking at some Ex Lincoln and the Galaxy models (Any other suggestions ??) and some have the SSB feature on there.. however, these a quite a bit more expensive. If you have FM f do you really need SSB ?/ I know that's what CBers would use for long distance, but how long distance is it and do you all think that it's worth the extra money ???

By far the most popular mode on 10 meters is SSB with CW 2nd,FM 3rd
and AM 4th.
I wouldn't go with any of the rigs you mentioned because a real 10
meter radio has some features you would miss.Try a 2950EX from RCI or
the radio shack 10 meter rig.The radio shack one goes for as little as
$139 new!

>you all think that it's worth the extra money ???

SSB is just a highly efficient form of AM It is a little more complex
to use but it has it's benefits. Here's an explanation why.

On A.M. , with a 4 watt carrier at 100% modulation , we have 2 watts
of audio power used for the sidebands. One watt on each sideband. This
duplication of sidebands is not necessary to convey intelligence.

If we use the same transmitter and convert it to DSB (double
sideband) by removing the carrier , we can now have 2 watts per
sideband.

If we now remove the other sideband , and concentrate all of
the power into one sideband , we have a 4 watt sideband. With
this method of removing the carrier and one sideband we can
put 4 watts of intelligence out on SSB as compared to 1 watt on
A.M.. This makes a SSB transmission 4 times as powerful as its
A.M. counterpart.

In addition to the above transmitting advantage , the SSB
signal has a receive advantage also.
Since only one sideband is transmitted , only 1/2 the bandwidth
is needed. This means that twice the number of stations could operate
in the same bandspace as A.M.. In addition to this , because the
bandwidth needed is only 1/2 of A.M. , only 1/2 of the atmospheric
noise is picked up with the signal. This gives you a 3db advantage
over an A.M. receiver.
So when you add it all up you have 6db gain on transmit , and
3db gain on receive. That's effectively 9db of total gain. This in
theory should equate to a distance multiplication factor of 2.8 . In
the real world it is probably somewhat less.

2700. Re: A URL for Tony at Palco!

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: palco@palcoelectronics.com
Message-ID: <38BC3B34.F4ACC320@palcoelectronics.com>
Source record: 25319

Hi all,

Well, once again, Chuck's up to his old antics. And, yet again, he's got his facts wrong -- so let me clarify a few of them:

Chuck's employment was terminated "for cause" -- NOT because he knows more about CB radios than me. In fact, I LIKE employees who know more about CB and Car Stereo than me. Any good businessman knows that it's smart to hire the best people you can. That's why Little Henry STILL works for me and has been PROMOTED to Sales Floor Manager and Ken, my Assistant Store Manager, has been with me for 10 years! (Big Henry, was studying CAD in school and left to take a job in his field.)

Of all Chuck's lies, I found the one about me waving my gun around the most amusing. If he could write coherent english, Chuck would be a pretty good storyteller. The fact is, here in Michigan, handguns are strictly regulated. They don't hand them out to people who are going to indiscriminately wave them around. The way Chuck tells it, you'd think we were reenacting "Saving Private Ryan" in the middle of the sales floor! LOL

Let me also say -- yet again -- that we DO NOT sell refurbished radios. I don't necessarily have anything against dealers that DO sell them, as long as they are clearly labeled. But we simply DO NOT sell them at Palco Electronics (never have, never will). It's simple: Our customers prefer brand-new, factory-fresh merchandise -- so that's what we've been selling for almost 14 years now!

The bottom line is that Chuck is a foulmouthed, disgruntled former employee who feels he has an axe to grind. Nothing he says would surprise me -- but, that part about waving a gun around WAS pretty funny! :-)

Regards,

Tony

> post this retraction in public.

> No tony didn't threaten me... I just felt bad about doing it.

> and No. I'm not friends with him, I don't even like him, But I do
> retract the Statements.

Well, Sir Tony. If you did read it above. You'll see I simply retracted my statement's that I knew for a fact that you were selling refurbished radios. I did not say sorry for that fact that I thought and still do think you are a poor excuse of a human being. You're a ASSHOLE, you treat your people that work for you, like SHIT. If I'm wrong, Why did Little Henry, Big Henry, and a few others walk out on you a year and a half ago? Why? Cause they were Sick and Tired of your bullshit. You don't talk to people that work for you with any kind of respect, at all... I remember once, I was there working, and his Car Stereo Dept Manager didn't have his side of the store cleaned up to suit Ol' Tony and Tony goes off on this Mad fit, Threating the poor kid, yelling and screaming at him, If that'd been me. I'd kicked his ass on the spot. Ever better, Once a kid brought an amp back that tony sold him, it was blown up, Tony told, tough shit, you blew it up, I don't give your money back, kid got huffy with tony, called him an stupid ass or something, Tony pulls out his gun, waving it around and shit. The kid threatened to get the cops there. Tony then starts kissing his ass and finally gets him another amp. I'll tell you folks, working at tony's shop was like working in a War zone. You didn't know when or where someone was gonna be shot or shot at. and he expected me to sell CB's out of there? and for what he was paying me??? $6.50 an hour. I made more money driving Straight Truck! (10.00 an hour.) and doing less work! and he wonders why I wouldn't solder mic's for him! I know how to do them, but not for $6.50 an hour!!!!!

My point, I don't discourage people from buying there. Just take someone with you who knows alot about CB radio, ect. or you could be taken for a sucker. Point is, he got rid of me becuase I knew more than he did. and I had better contacts than he did. and he couldn't handle it.

Period. End of Story.

-Signed

-Chuck

Last spring I used 12watts to work Canary Islands, Azores, Spain, Portugal, western Canada, and Ireland on St Patricks Day. I've worked So. America from my back yard with 25 watts. Try that with AM! I need my linear to work the western high plains. 10 meter SSB is great when its open.

Source record: 25323

I have a PDC(Power Dynamics) Power/Roger beep(The annoying 3 tone RB) mike and it likes to squeel like a stuck pig unless the mike gain on both the mike and radio(Uniden Grant XL w/modulation cranked up) and then there is no audio. I turn either one up and it squeels. I tried the 0.1uf disk cap thing and had not an inch of luck. There is a PDC-60(Power/echo) mike in a catalog I have that says it has a 1k ohm impedance. Right now I have the Astatic 575-M6 mike on the radio and it really screams(Sounds great and not a hint of a squeel!). I was wondering what the impedance of the astatic 575-M6 is and would changing the impedace on the PDC mike to be the same as the Astatic work? If so where would I add the resistor? Or any other ideas. I need this mike to work as I have a radio with no mike in one of my trucks. I tried a few things that others have suggested and had no luck. If nothing else fails I will have to run it over with my big 42" ground haugs on my pickup. Someone please help. I hate to toss a pretty new mike. Bought it from a friend who unfortunatly bought it from a truck stop out of state so I can't return it.

Thanks in advance and 73's

Greetings!

Due to the design the vehicles' enginners want. The most metal the antennas will work with, is along the length of it's forward to rear axis.

This already enhances the effects of signal capture. Either by co-phased or use of a single, omin-directional, pattern afforded by the typical single antenna whip most people use.

When they want directional patterns, the best effect is to use the out-of-phase condition that occurs using 1/4 wave length feed designs.

Along with the above, the best pattern is obtained from the cancellation and reinforcement that co-phased antennas provide - which is also enhanced when the antennas are mounted perpendicular to the main axis of the vehicles center - that being on the sides of the vehicle mounted towards the centerline in distance, at the highest point obtainable above the center. Also, separation of 102 to 108 inches with ideal being close to 106 inches of distance between the two antennas.

Another aspect of using co-phasing, is that they are less likely to balk at the use of fiberglass mounting locations - the phasing harness provides the conjugate matching that makes these antennas popular with semis and larger/wider clearance vehicles. You still have the major lobe problems - but they can work when other antennas can fail to do the job.

On 27 Feb 2000 19:10:18 GMT, while the modem was pondering it's navel, hamm4fun@aol.com (Hamm4fun) dissertated the following:

>Co phasing at less than optimal spacing can still be usfull as it evens out the
>radiation pattern. This is especially true on trucks with the antennas mounted
>on the side of the bed or the mirrors. The radiation pattern can be skewed to
>where the power is going in some pretty useless directions with just one
>antenna. This was originally the main purpose of co phasing. You can also get
>over 4db of gain with spacing of about 4 ft but the main lobe will be inline
>with the antennas. This might be nice for antennas on top of a bus or
>motorhome.

Greetings!

Usually it's a free-running oscillator...

What makes the rising arc is because of the plasma generated when the
air is ionized, makes the spark see an easier gap to jump. Since heat
rises, so does the plasma, and the spark uses the superheated air and
ions to complete the jump - to the point that the elongated arc can't
jump past the top electrodes and starts at the bottom again.

On 29 Feb 2000 04:47:57 GMT, while the modem was pondering it's navel,
Bill Nelson <billn@spock.peak.org> dissertated the following:

I tried using a wall mount adapter for my Radio Shack TRC-230 handheld CB. I could talk to people but they had hard time hearing me because of the AC Hum from the adapter. I do know some one who has one of the 12 V/13.8 V power converters like Radio Shack sell, he uses it with both his handheld and mobile CB's and has good success with them.

2710. mic wiring question

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: Ron Croonenberg <R.Croonenberg@ATISnet.com>
Message-ID: <38BC45D8.A5B35752@ATISnet.com>
Source record: 25329

It's probably asked a million times on here but here it goes....

I want to hookup a headset to my CB instead of the regular mic.
(The CB is in a Jeep, and that's noisy enough so you can't hear a
thing.)

I already have a pretty good quality headset I can hook up with a
combined mic-audio plug.
Thing I need to know is though how everything is hooked up in a regular
mic.

I hope that the 4-pole plug is the same for every cb...right ?
Can someone tell me what wires are actually from the mic, and what wires
are coming from the switch ?

TIA,

Ron

Greetings!

Well, look at the sig at the bottom of your message to remind you of
why the CB world took off back in the "inflationary 70's"...

Truckers would use the CB to radio or relay smokie and gas-pump prices
for other truckers to either slow down [less efficient for the diesel
fuel chuggers due to gearing/torque ratios were less effective - but
you avoided speed traps and tickets from the imposed 55MPH limit] or
kept one station in business providing cheaper gas than other stations
that kept the markup down and fuel fresher [nothing less fun than
stale, watterlogged or gelled diesel fuel].

On Sun, 27 Feb 2000 18:36:51 -0500, while the modem was pondering it's
navel, "Dave or Debby" <truth@planetc.com> dissertated the following:

>Well, what do you think? Any of you CB shops out there that mainly work for
>truckers notice any loss in business yet, or is it only affecting CB shops

From: CodysPC@Iserve.Net
Message-ID: <38bc4fc0.3428790@news.iserv.net>
Source record: 25331

Greetings!

Well, let's see...

Theres' at least a few discretes [power supply alone have a few switching transistors - it doesn't have to be clean does it? ;-] - Does this mean that I have to chisel apart the CPU to get at the Xtal multipliers? [Or could I?]

As far as what would be needed for SSB. The A/D D/A converters used in the MIDI section can be manipulated for a balanced modulator. The A/D can be used to compute, or analogous to, develop the offset for the carrier and there's enough low MHz xtal crystals for Hard drive timing - in fact you could problably pump up the old CD rom with Windoze 98 spinning away to develop a clock reference for audio conversion...off the CD-Rom timing circuits - a Hard drive can accomplish this too, using it's spindle timing circuits.

Toriods used in the power supply would be used for the switching transistors.

Some simple SMD caps can be fiddled with to use the CPU Xtal and buss drivers can supply the variance for some "channel selection" ability. Legasy ISA is not dead!

There are plenty of diodes for detection and RX/TX switching.

On a typical sound card, there are plenty of components that can be used for the audio drive and speaker, and mic inputs for driving the Hi-Po Hal-2001 CPU CB!

Coming soon, I'm afraid. Can't be too long before they find out that < $200 will buy them a modified 70cm ham rig that can be used illegally on FRS. 5-35 watts is more than enough to cause mayhem on those frequencies.

>Just kick on the CTCSS tones and the bad people simply go bye bye.

Depends on which radio you have. When I put my Talkabout 280SLK in scan mode, it displays both the channel AND the tone being used as soon as it stops on a signal. If you then choose to transmit, it automatically selects the correct channel and tone. A nice feature, but one that can easilly be abused.

Source record: 25337

I am using a ground-plane on my base 25' high I do not no what brand it
is but it is
18' tall with 4' ground-plane radials
The problem I am having is as follows
I can only transmit and receive in one direction it acts like a
directional antenna
but it is not.
I think the biggest problem is that I live in a trailer house and the
antenna is surrounded by a ten roof and ten sides. I cannot move the
antenna nor can I go up any higher
is there anything that can be done to get this antenna to work in all
directions.
I thought about putting the 4' ground-plane radials to the positive
side, don't no if that will work or if that care of the problem.

Message-ID: <25082-38BC5FF7-80@storefull-118.iap.bryant.webtv.net>
Source record: 25343

In the past i have read many postings from people who have had bad dealings with Coppers Electronics. Not being one to jump on the bandwagon unless it has been proven to me...and having had good service from them for over 2 years, i pointed this low prices and good service out several times when people asked about where to buy a radio other than Coppers etc.

Man what a @#%*&#@ MISTAKE!!!! These spineless clowns from hell have in the last several months :

1. Shipped a radio i ordered to a guy across town who has the same first name as me.

2. Shipped a microphone i ordered to the same guy...after having been told by me twice, and him once to please get their order and shipping departments wired together...and then made me wait for it to go back to Kentucky to be re-addressed and re-shipped to the correct address.

3. Made me wait several days on an Astatic 575 M-6 with 6 pin wiring microphone order before proccessing...and when i got my package, lo and behold...it was a Wilson 1000 antenna!! They issued a UPS call tag on the package and said it would not happen again...the order go' s out again (after i called them repeatedly asking why the order was being held and not shipped for 3 days after they had already received the Wilson Antenna back) and when i get it inside and open it up...it had not been wired for a 6 pin radio like i paid them $10 to do!! And to top it off...they sold me the prewired 4 pin Astatic microphone, even though i paid to have the mic prewired for a 2950. See...the $10 fee to wire a microphone includes the plug you want it wired for, but Coppers wants to shaft me out $5, so they expect me to really think that they are going to take a prewired 4 pin Astatic microphone, remove the plug, then put on the 6 pin plug i paid for instead of just selling me the $39 doller 575-M6 that comes with no plug and putting the 6 pin plug on that. Maybe their tech is so bored he loves to pull the plugs off of prewired mics so he can turn around and rewire them. When i called up customer service and pointed this out...i was told by Suzanne, who likes to hang up on me even though i am polite, that the 4 pin version of the microphone has a ' special feature ', and thats why they sold me that version. Yea right...and i wonder what she was doing with her other hand!! Now i am waiting for UPS to pick up this latest wrong order...and i have given Copper instructions to cut me a refund check, since they cannot fill my order correctly no matter how much time they are given to do so.

Let this be warning to others that are considering doing business with this incompetent no-assed company another time...or for the first time. This microphone order has taken over a month so far...and for all that

time invested i am now looking at another month just to get a refund. Thats over 2 months total...completely wasted, except for the golden lesson. I only hope they do not try to get revenge on me for telling the truth about them on the newsgroup and cheat me out of it. I will post the result either way. Best Regards

Is it at all possible to put a 5/8 wave antenna on a 5 element beam? Or will it affect the SWRs of the beam? With the limited amount of room I have as far as property line goes, I used a seperate push-up mast for the verticle but the beams SWR sky-rocketed. With the beam on the tower and the verticle stationed about 20 feet away, the SWRs on the beam went from 1.1:1 to 2.5:1 on 27.025. So I was wondering if it would be plausible to mount the verticle above the beam and use the beam itself as a GPK. Is it possible?

The Jacobs ladder high voltage electronic display device may produce
variable disturbances accross the band at diff times due to the fact that
on most of these devices the spark gap is graduated from 1 to 6 inches.
The spark crawls up the V positioned conductors at regular intervals. A
device like this could very well be the source of the emmisions IMHO.

That's what happens when you go to THE corporation. Next time go to your LOCAL 'Little Man" NON-modulation kit installing CB shop. You'll be GLAD you did. More competant locally. How do I know? I is one! Dave!!!!!!!!

Bendthelite@webtv.net wrote in message <25082-38BC5FF7-80@storefull-118.iap.bryant.webtv.net>...
In the past i have read many postings from people who have had bad dealings with Coppers Electronics. Not being one to jump on the bandwagon unless it has been proven to me...and having had good service from them for over 2 years, i pointed this low prices and good service out several times when people asked about where to buy a radio other than Coppers etc.

Man what a @#%*&#@ MISTAKE!!!! These spineless clowns from hell have in the last several months :

1. Shipped a radio i ordered to a guy across town who has the same first name as me.

2. Shipped a microphone i ordered to the same guy...after having been told by me twice, and him once to please get their order and shipping departments wired together...and then made me wait for it to go back to Kentucky to be re-addressed and re-shipped to the correct address.

3. Made me wait several days on an Astatic 575 M-6 with 6 pin wiring microphone order before proccessing...and when i got my package, lo and behold...it was a Wilson 1000 antenna!! They issued a UPS call tag on the package and said it would not happen again...the order go' s out again (after i called them repeatedly asking why the order was being held and not shipped for 3 days after they had already received the Wilson Antenna back) and when i get it inside and open it up...it had not been wired for a 6 pin radio like i paid them $10 to do!! And to top it off...they sold me the prewired 4 pin Astatic microphone, even though i paid to have the mic prewired for a 2950. See...the $10 fee to wire a microphone includes the plug you want it wired for, but Coppers wants to shaft me out $5, so they expect me to really think that they are going to take a prewired 4 pin Astatic microphone, remove the plug, then put on the 6 pin plug i paid for instead of just selling me the $39 doller 575-M6 that comes with no plug and putting the 6 pin plug on that. Maybe their tech is so bored he loves to pull the plugs off of prewired mics so he can turn around and rewire them. When i called up customer service and pointed this out...i was told by Suzanne, who likes to hang up on me even though i am polite, that the 4 pin version of the microphone has a ' special feature ', and thats why they sold me that version. Yea right...and i wonder what she was doing with her other hand!! Now i am waiting for UPS to pick up this latest wrong order...and i have given

Copper instructions to cut me a refund check, since they cannot fill my order correctly no matter how much time they are given to do so.

Let this be warning to others that are considering doing business with this incompetent no-assed company another time...or for the first time. This microphone order has taken over a month so far...and for all that time invested i am now looking at another month just to get a refund. Thats over 2 months total...completely wasted, except for the golden lesson. I only hope they do not try to get revenge on me for telling the truth about them on the newsgroup and cheat me out of it. I will post the result either way. Best Regards

> plus shipping.

Since no one seems to want to offer any information to you let
me have a go at it.
You haven't offered any info about the rest of your station so
I'm only able to guess.
First let me say that it is possible that you may have blown the
transistors yourself through no fault of your own.
This can happen if the power supply you are using is being
affected by the extra RF. I've seen many *good* supplies go crazy
when some RF gets on the leads and into the regulator. The RF
usually causes the regulator to put out full voltage which can be on
the order of about 20-25 volts. An example of a power supply that is
affected like this is the Astron brand. I've also seen the Pyramids
and a few others that will do this.
If this is the reason for the failures you can prevent the
problem from re-occurring by installing a couple capacitors to the
chassis from the (+) and (-) leads on the power supply leads. You
might try values of 0.01uf. or so. When you open the supply you may
find a cap or two across the output leads but probably not to the
chassis from those leads. By adding the caps you will be minimizing
the difference of RF voltages between the output leads and the
chassis.
Another problem may be with your antennas' swr. I don't know if
you checked this or not but it wouldn't be bad idea just to make
sure. Also make sure your connectors aren't intermittently making or
breaking connections by gently moving them around as you check the
swr.

If your radio is of the high power type this may also contribute
to the demise of the amp. I don't really know how much a Palomar 225
can take for input without blowing but I would suggest anything
above about 5 or 6 watts combined with a high power supply voltage
could easily do it.
Anyway that's all I got for now. Good luck.

2736. Re: SSB ?? is it worth it ??

Newsgroup: rec.radio.cb
Date: 2000-02-29 00:00:00 UTC
From: Scott McClements <yetbbwa@grove.iup.edu>
Message-ID: <38BC2AC1.E34D6BA4@grove.iup.edu>
Source record: 25355

Yes. Absolutely. FM does have really superior sound
quality to the other modes, but SSB, in my opinion is
the best mode to run all around. For one, its so much
more quiet than AM. The static isn't cranking all the time -
its alot lower.

For weak signals, you can still hold a conversation
on SSB with barely a signal, whereas on AM or
FM, it will give you a headache after a while from
the noise. Get a SSB rig with upper channels
27.405 - 27.855 and see what CB is all about.

Distance? Is around the world far enough?
On the local path, you will definately gain
some good range.

Reincarnated Bob.

After shorting out the correct place on the board - to
reset the CPU, do you short those two places together
momentarily while the radio is off? Or what?
What is the right procedure for reseting the ECU?

Also, how do you change bands? Does the radio just
cover the 120 channels after the mod without need
to change bands? Or what?

It took a while to decipher this message, but I gather that you have a
vertical antenna whose base is 25 feet above the ground. The radiation
pattern is being heavily affected by the metal structures. Is there a
possibility that you could move it to a different location, or best,
some distance from the trailer? I suspect that The mass of the trailer
is creating the problem.

You can't skip on FRS.... extra "paar" wouldn't git then too far. Plus the
cost of a UHF rig wouldn't be worth it to them..... if they bought a UHF
rig, they'd just as well bootleg on 440.

>>Just kick on the CTCSS tones and the bad people simply go bye bye.

yeah... but how many would go to the trouble?

27 Mhz is the perfect environment for the "bad guys" on CB. As far as i am
concerned, they can have it... you will get no complaints from me.

I made it a point not to get the CBers to change their ways... as long as
they kept it on 27 Mhz.

Dont know if you tried, but check the mic plug and inside the mic
itself for a shorted wire. Sometimes a broken or shorted audio wire
will make it squeal real bad.

I too am interested in ham and in looking at radios I find the Galaxy
DX99 nice looking.
Can you explain the technical differences between Galaxy and other
radios you favor? I like the Galaxy DX99V because it is small and fits
the
space I have available.
Thanks,
29

Does anyone know what a Lafayette LMS-40 is similar to or what Sams it can be found in? Maybe you have a schematic or service manual for it. The one I picked up was butchered by some a$$hole trying to add channels. It's in good cosmetic shape and I would like to see it work again. Thanks in advance.

>What is the freq range when running galaxy on fm mode?
>Thanks,
>Ken

Ken,
The frequancy does not change no matter what frequancy you are on only the mode of operation. IE... if you are on 26.965 (ch 1) and you change from AM to FM or one of the other modes you will be on the same CH 1 just using another mode of modulating your signal.
Have a great day,
Sandor KG4FET

A "wall-wart" AC to DC converter should work fine. Make sure its
REGULATED, and can pump approx 1 amp at 12 volts. Lack of adequate
regulation and/or trying to draw too many amps (or milliamps) is what
causes the 60hz hum.

Interested in hearing about 10 meter ssb rigs.
Never spent a lot of time on ssb.
Looking for recommendations.
Need 10 to 15 watt drive rms am.

I run a George now (on am) and like it, but I am looking for more ssb
control.(like a fine and coarse clarifier)
Should I go to the Lincoln ??

Thanx for your help

They were called Crystal Matrix sometimes. In fact, there were
even kits for a while.

Lafayette sold a CB with some crystals in it, and you added
to the matrix to add channels.

Thats kind of like saying,which one should I dance with the blonde, brunnette, or the red head, you pick for me,the President radio's are great,Galaxy's sound great, [think they could have put more into the radio than the STUPID noise toys],theAlan9001,is a clone off the old Emporer and sounds great,I prefer the Ranger's over all, but keep in mind each radio, and brand has different merits,its what fills your needs, if you'd like a well made,go anywhere type,that continually performs,I'd start with a Ranger 2950,I would say that the best buy on a simular radio is the Eagle Sidewinder400,cheap and will go everywhere,if you can afford it the 6900 series of Ranger's,its up to you ,and also will it be a base or mobile,remember you need a good power supply to run those kicked up mobiles,start adding up the prices and it can make one of the base radio's price's look a bit more realistic, I myself would rather put $ into a used all band HF rig,rather than approx. the same amount into a new base that limits your up grades beyond 10 meter, on the other hand tho, they tend to work excellent on 11, freeband and 10,if thats what flips your switch, good luck,

You can get a trunk-lip mount and a magnet mount for a Wilson 1000.
If you would like to mount it on a 3/8" mount, you will need a
"trucker" version of the antenna.

I was able to pick up a used ICOM 729 for about $500, they are probably even cheaper now. Puts out about 100 watts PEP and is adjustable down to 10 watts. Has XIT RIT and a lot of other uselss things. The 728 is about the same thing but it does not have 50Mhz like the 729. Both rafios can be controlled through a computer interface. While I wouldn't call these units MOBILE they do run off of 12VDC and require a power supply to run as a base.

Yes, there are wall wart power supplies arond with enough ummph to handle a 4watt CB. I have one that does 1.8 amps but there is no filter in it. Had to mount a filter cap in the radio.

2792. Mike squeel part 2! HELP!!!!

Newsgroup: rec.radio.cb
Date: 2000-03-01 00:00:00 UTC
From: oneqck76ta@aol.com
Message-ID: <20000301140609.01254.00001554@ng-fq1.aol.com>
Source record: 25411

Hello again. I have good news and bad news! I got rid of 1/2 of the squeel by placing a 22k ohm resistor inline of the audio wire but now it sqweels only under the weirdest conditions. If you ever touch a part of a board in a cb and it hums? Well, when ever I get my hand or mouth close to the mike it squeels like I am the talkback speaker or a huge chunk of RF. If i hold the mike just right it won't squeel but who wants to hold a mike like you have a hand full of broken fingers. It is like there needs to be some sort of filter on it. I have never had this mutch problems with a cb/mike in the 10 years I have had radios. Any help would be great before i destroy this thing. Sound good when it doesn't squeel. read below for info on the first post if you have not read it.

Thanks in advance and 73's
Kevin
oneqck76ta@aol.com

<In a previous message, OneQck76TA@aol.com wrote:>

I have a PDC(Power Dynamics) Power/Roger beep(The annoying 3 tone RB) mike and it likes to squeel like a stuck pig unless the mike gain on both the mike and radio(Uniden Grant XL w/modulation cranked up) and then there is no audio. I turn either one up and it squeels. I tried the 0.1uf disk cap thing and had not an inch of luck. There is a PDC-60(Power/echo) mike in a catalog I have that says it has a 1k ohm impedance. Right now I have the Astatic 575-M6 mike on the radio and it really screams(Sounds great and not a hint of a squeel!). I was wondering what the impedance of the astatic 575-M6 is and would changing the impedace on the PDC mike to be the same as the Astatic work? If so where would I add the resistor? Or any other ideas. I need this mike to work as I have a radio with no mike in one of my trucks. I tried a few things that others have suggested and had no luck. If nothing else fails I will have to run it over with my big 42" ground haugs on my pickup. Someone please help. I hate to toss a pretty new mike. Bought it from a friend who unfortunatly bought it from a truck stop out of state so I can't return it.

Thanks in advance and 73's

Using that particular amp would be illegal for a licensed ham on 10
meters,thats why you don't see them for sale at HRO or AES like the
legal amps.

You don't! Stick to
> the pertinent information that he requested.

Answer yourself instead of knocking other peoples answers.

Actually...it was $71 delivered. The Cb shops in my area are even lighter weights than Coppers, i would not give them a dime. They are extremely overpriced and lack the skill to do things right. The money issue was not the core of my point...Coppers inability to complete an order properly no matter how much time given, was.

Usually things like memory channels,split trancieve,CW,CTCSS,scan,and the ability to tune across the band instead of in these idiotic 10KHZ(channel)increments.
Real 10 meter rigs will be missing some of the CB features like echo boards and transvestite boards.
For a cheap rig I like the RCI 2950DX because it has 10 and 12 meters.The dumbing down (restructuring) of the licensing system makes a 10 meter radio a lot less attractive,now with 5WPM and a few memorizes questions you can enjoy all the HF bands so why not get an all band radio? Good new ones startb at about $650 and good used ones at about $300.

Thats not your problem,anything causing your antenna to be directional
would have to be vertical,anything around?

IF the beam is horizontal then put the vertical over it but forget using
the beam as a ground plane,you need resonant radials or nothing.

Does anyone recall an antenna company or distributor that was called Ham International? A fellow breaker is trying to track down an antenna called a *Big Mac* (nothing to do with the burgers) that was distributed by them.
It was a base loaded vertical 7/8 wave antenna that was that was 9.9 metres about 38 feet high. It was quite popular here in the UK in the mid 80s and early 90s, although there may have been a few around a couple of years ago. It was of aluminium construction but sadly due to its length was prone to breaking in high wind conditions. The antenna was possibly constructed in Holland.
They also produced models marketed under the names of Thunderbird, Highpower, Quatro and Sexy.
Ring any bells out there?

I raised my antenna by just 2 feet and there was loads of difference. We can get by now. I still don't know what the problem was. Yesterday I was talking to someone 30 miles away and they were so much clearer than the person over the hill who is just 7 miles away. I have decided against a power mike because of the last post.

Thanks,
Matt.

2820. Best CB Value

Newsgroup: rec.radio.cb

Hi fellas,

I am in the market of purchasing a mobile CB radio.

I have done some research and have heard a lot of guys praising
the Uniden 510XL and 520XL as being the best bang for the buck.

I am looking for a good overall value that has a good track record.
Is there such a thing as the "best cb radio".

I would love some recommendations.

Many thanks,

Sent via Deja.com http://www.deja.com/

Sure they can,just can't use this type of mass-produced unit meant for
10/11 meters.

You might have better luck finding ANYONE using the internet rather than trying to find someone who has a callbook. Remember, those licenses ceased to be issued about 23 years ago, and folks move and die. Search the internet.

Thanks, just what I wanted to know. Guess I'll work on my 2950 mobile this weekend, BTW. Thought about it before but didn't know what I'd gain. So how many watts is that Uniden good for? I'd settle for a littile less given the price difference.

I gave him an answer. I told him to evaluate the input power from the transceiver. Can't you read? Beyond that, his whole approach to the matter--wondering why he didn't get a warranty, wondering why he doesn't get support like he would expect from a legitimate manufacturer--it simply needs to be pointed out to the guy that he is dealing with an illegal product. From his tone, it appeared to me that he wasn't aware. Please don't jump on me for telling the truth. It matters not if you like it or not.

Message-ID: <20000301202313.01240.00002957@ng-xe1.aol.com>
Source record: 25459

I have a PDC(Power Dynamics) Power/Roger beep(The annoying 3 tone RB) mike and it likes to squeel like a stuck pig unless the mike gain on both the mike and radio(Uniden Grant XL w/modulation cranked up) and then there is no audio. I turn either one up and it squeels. I tried the 0.1uf disk cap thing and had not an inch of luck. There is a PDC-60(Power/echo) mike in a catalog I have that says it has a 1k ohm impedance. Right now I have the Astatic 575-M6 mike on the radio and it really screams(Sounds great and not a hint of a squeel!). I was wondering what the impedance of the astatic 575-M6 is and would changing the impedace on the PDC mike to be the same as the Astatic work?
Run the Astatic 575-m6 mic, put resistor 131 back in, and ground your radio and boxes better, or ground them period. All of your equipment will then sound great!!!! Anything much over 100% mod in the Grant is unneccessary anyhow, because it sounds trashy! That is a great radio if you don't mod it too hard!

2841. Re: Will HIGH Diesel FUEL PRICES hurt the CB business ?

These radios have very good transmit capabilities, but poor reception. The Uniden PC68XL would cover both areas and be your best "bang for the buck". Wm.

SSB is DEFINATELY the way to go! With an A.M. signal, 50% of your output power is 'wasted' in the form of a carrier. Not so on SSB. And if you are honestly going to be a ham on 10-meters, disregard the Galaxies, and all of the other "export" radios. An RCI-2950 or President HR-2510, or Radio Shack HTX-10 will fit the bill! The ham tests are easy. 2-meter/440 is a BLAST. But PLEASE, in all of your radio endeavors, do it LEGALLY.

Thanks for your advice.

I have put the Uniden PC68XL on my list.

Do you know if there any Realistic (Radio Shack) models out there
that are worth considering and perform well.

I have a friend who is selling the TRC-487 (97 model).

I can read quite fine thank you! Never said you didn't answer his question. I won't be drawn into a pissing contest. I wasn't jumping you, sorry you feel that way. Just tired of people pissing and moaning about legalities every time someone mentions a box that doesn't conform to the hams. It is obvious you feel the poster has no clue he is operating an illegal amp just because he inquired about a warranty. One may purchase many illegal electronic devices(descramblers, certain eavesdropping devices, etc.) that have warranties through catalogs and other outlets, so it is easy to understand why one may feel a warranty may be available on these readily available amps. Hell, you see it here on this ng that several amp distributors offer warranties. Can see why he wondered about a warranty. Unfortunately, in his situation, it is buyer beware. Ya' think all these fellers buying the xforces, Davemades and Foxies are aware they are illegal? Maybe ya' ought ta' tell 'em! Have a good day.

2854. SPP-A250 Sony cordless phone lost its range

Newsgroup: rec.radio.cb
Date: 2000-03-02 00:00:00 UTC
From: edwastrodowski@my-deja.com
Message-ID: <89l2omvmp1@nnrp1.deja.com>
Source record: 25473

I've read with interest the discussion on extending the range of cordless phones. My problem is 'I just want my original 50 foot range back on my 49 Mhz Sony cordless phone with answering system #439461' . We let the battery run down once, to the point where the 'battery low' light came on, and then we lost the range.. down to 5 meters!

I've replaced the battery with a new one from
http://www.batterybarn.com/
but to no avail. I've called Sony service, and all they suggested was 'unplug it for 30 minutes' and then plug it back in. That did not help.

But why would losing battery juice cause a permanent loss of range? Is there a volatile memory chip in these things that needs re-programming? Perhaps there is a tuning pot in the receiver that needs adjustment?

I know. it was only $120 about 3 years ago.. but still.. what could've happened to it? And I bet all the scanners in the neighborhood have no trouble hearing our phone calls...

Thanks for any troubleshooting tips.

Ed

Don't need one... For an Omni, get an I-MAX2000. For a beam, get either a Moonraker 4, or a Shooting star. And go to a ham site http://www.aesham.com and order some Belden 9913 RG-8U coax. And DON'T listen to ANY posts after this one! I've been on the radio for 25+ years. Been there...Done that!

. Get a SSB rig with upper channels
> 27.405 - 27.855 and see what CB is all about.

Don't know about where you live, but around here most of the upper channels are run by Mexicans, both local and skip. They also like to run between, screwing people on both adjacent channels. I can find a quiet channel- listen for about 15-20 minuets- nothing. As soon as me and another person start talking, they start in also trying to run us off.

I don't know if any of these problems are connected but I will list
all of them just in case it helps .

My main problem is that when the box is on standby the receive is fine
but when I put it on high or low I lose my receive .

It only does 180w on low and 200w on high .(probably needs a tube)

And the meter on the front of it says it is swinging backwards (heavily)
but my dosy says its got 20w forward swing . the guys I talk to on the
radio said that it definitely was swinging forward .

THANKS in advance
BENZ

I think by now we can make just about anything talk. I am looking for the best ears possible. How well can it receive? Do the noise limiters and blanker work? Adjacent channel rejection? How about sensitivity? Are there any mods available for the RX as well as TX? I had an old-timer tell me once it is easier to transmit than it is to receive. I'd be interested in thread.

FM more efficient - it certainly appears to be. Can't say I have ever seen any figures however it has been my experience that FM will beat AM hands down. I don't operate it very often but the clarity of the signal is far superior and when AM drops out I can still comfortably continue a contact with FM. The ten metre FM section is a good example of the clarity of the mode, have a listen up there and you will understand what I am talking about.

2871. **RCI 2950 10 meter radio For Sale**

Newsgroup: rec.radio.cb
Date: 2000-03-02 00:00:00 UTC
From: roly4955@my-deja.com
Message-ID: <89lqon$g8j$1@nnrp1.deja.com>
Source record: 25490

hello all. This radio has never been serviced for any reason. Comes with an Astatic 575 m6, mounting bracket and all hardware. Also includes a woody woodpecker sound toy. Memory battery is still in perfect condition. roger beep is never used on it either. Am selling for $125 shipped. Thanks all in advance....Roly 73's

From: roly4955@my-deja.com
Message-ID: <89lr2b$gb9$1@nnrp1.deja.com>
Source record: 25491

Hello all. This amp has eight (8) Toshiba 2sc2879's. Is capable of some large numbers. has built in fan for improved cooling, high, low, medium power settings, recieve amplifier, and and SSB switch. Amlifer draws some amps so have the right mobile setup for it. I am selling this amp for $350 shipped. Internal driver was cancelled (which was a Toshiba 2sc2290) so an external driver could be utilized. thanks all in advance....Roly miami,fl.....73's

2873. **For Sale..Leece Neville 160 amp alternator NEW**

Newsgroup: rec.radio.cb
Date: 2000-03-02 00:00:00 UTC
From: roly4955@my-deja.com
Message-ID: <89lr8v$gl4$1@nnrp1.deja.com>
Source record: 25492

Hello all. This alternator is brand new in the box and still sealed. It is the larger casing with the bigger rectifiers than the smaller case offers. Is capable of both AC/DC. Am taking offers on the alternator! definitely a must if you are looking for some real watts rather than PEP watts. Thanks all....roly

why try to squeeze every last watt out of either one? that will cause early failure. buy the better radio and go with a small amp like a blue face 225 and youll be better off and have a great station running clean and putting out alot more than either of the radios will do.

>
>Anyone have an opinion on this rig and its RCI version? I've read all the

for am go with the 68xl and for ssb go with the pc122xl. the 122 goes for around 100 bucks and does well on sideband.

Source record: 25495

sideband conversations in the freeband happen on all of the freqs not just in 10khz steps. its better to get a radio already capable of going between freqs than to have to tie a clafier or some other mod to a cb style radio with a channel selector

>What's wrong with the channel selector type?
>
>--
>Miles Davis
>This is CB radio.....No crying allowed!

Source record: 25497

dosy meters are peak reading!!!! they will show forward swing almost no matter what. thats the very reason i always tell people with boxes to have a rms meter to tune up with at least. reduce the drive into your box and tune it until the meter on the box is swinging forward and youll sound much better and wont be frying your tubes like you are now, there getting pricey. sounds like your relay for the box is sticking and its not fully going into recieve. a good way to clean them is to put a single sheet of paper between the contacts where they close and drag the paper thru the relay while it is closed. this usually cleans them enough to work again. have a good day and please remember dont listen to the dosy when it comes to whether or not your backswinging get it right with the meter on the amp

>
> I don't know if any of these problems are connected but I will list
>all of them just in case it helps .
>
>My main problem is that when the box is on standby the receive is fine
>but when I put it on high or low I lose my receive .
>

>From: edwastrodowski@my-deja.com
>Date: 03/02/2000 12:46 AM Central Standard Time

>But why would losing battery juice cause a permanent loss of range? <

It's possible that in letting the battery get too low, the lower voltage damaged some of the solid state devices. They have specific operating voltages, and if that's not maintained, both too high and too low, you run the risk of damage.

Just chaulk it up and get a new one. 49MHz corless units are now on the market for under $25...even the "good" ones.

I realize the dosy is going to tell me that its swinging forward when its not , but I didn't put the rms meter inline because I also got a couple of radio checks and they all said it was swinging forward . thats why I thought there might be something wrong with that circuit . I've tuned allot of boxes and I know how to tune it , the only reason I mentioned it was because I thought it might have something to do with my receive problem .
When I got the box the first thing I did was change the relays in it , but that didn't help , I still don't have any receive .
I realize this post may sound cocky or defensive but its not meant to be , I just wanted to get all the facts and info out there in the quickest way possible .

Question: Exactly how many "beams" are there in a set? Are they a matched
set? Or do you take, say, four, three-element yagi antennas that look
alike, and stack them for one set of three beams?

Billy Bob

put the meter inline regardless just to make sure. radio checks are only as reliable as the people you get them from and its your equipment not theres so you would want to be sure

You can also keep your phone disconnected and carry it with you. If in case of an emergency or you just need roadside service, besides calling 911, you can attempt to call with the phone. If your service is not "hooked up" then a cellular phone operator comes on the line asking for a credit card number to bill the phone call to. It costs between $3 - $5 a minute, but a once in a while call might be better than constantly paying a monthly access fee.

The lower the frequency the longer the whip. Best thing to do is go to
the hardware store and buy a stainless steel whip and use it to test
cut if you need to. Then when you get it exactly where you want it,
Leave it and then you have a whip for 10 meters and one for whatever
else. Matchers work excellent in loading and tuneing for a good match,
but you will not get out as good as if you were to just have a better
tuned antenna.

Well, what Jeff is trying to say is probably accurate, even though I had to read it several times to understand it. It was nice of him to caveat his statement with "I know nothing about the antenna"

(Really, Jeff, you should learn to spell. It would add tremendously to your "grey matter")

Does anyone have a web site for the manufacturer?

==========

Only the european models have FM. For US sales they remove the FM board, although everything is intact for FM operation. I suppose if you get ahold of an FM board then it may be possible. I think it may be able to receive FM as is though I'm not sure.

Yes. Yes. The 572b is capable of much more voltage than that amp will
ever give them, so the tubes hould last forever.

>
> Ed

Hiya Ed,
The unplugging of the base was the deathnell for those three year old batteries. Those batteries only last a couple years before their capacity is reduced to almost half.
You should charge the new one overnight to make sure it gets a good charge. You may have received an old or defective battery. If you have the means to check the voltage of the battery do so. New and fully charged you should read aprox 1.3 volts per cell.
If the battery checks out ok then look at your antennas. I don't know your unit but it may have an antenna in the short telephone lead coming out of the base. Make sure this wire is not coiled up, it needs to be hanging full length.
Now that I reread your post, I noticed your original range was only 50 feet? You should be seeing a reliable range of about 400-500 feet. If your original range was less than this perhaps the unit is damaged from the beginning. Good luck with it.

The 572's will plug in, but need a different bias. The amp would need to be
modified. The ameritron's aren't the best quality amps out there, and will
not supply the extra power the 572's require. You'll cook something quick.
Leave the 811's in it, and buy a different amp if you need more power.

From: Billy Bob <BigtimeR@dio.org>
Message-ID: <cNEv4.6359$kO5.36404@typhoon.tampabay.rr.com>
Source record: 25544

The change is a simple drop-in, the tubes cost three times as much, for the same output. The 572's are bulletproof in this configuratin, since they will be loafing along on the 1750 volts that the power supply provides. They are designed to be powered by much more, and at 1750, they should last forever.

Most of the popular 10 meter rigs will convert to cover all the 10
meter, 11 meter and some 12 meter. While these do that, they also put
out a little more power than a regular cb does. Those are the main
reasons and plus they offer better rejection than some CB's. That
simply sums it up.

Even a 1/4 wave antenna on the CB band is 8'-9' long so you can't
expect much at all from your setup.

According to the FCC even though the use of this type of amp is not
specifically prohibited the rules against manufacture infer the
illegality of use as well.leave amateur radio to people wh0 know
something about it so you won't sound like a lid.

If it has the stock two amp fuse on the 120 line then you could
assume 120 volts times 1.5 amps = 180 watts of input power.

!80 watts divided by 35 volts = 5.14 amps

5.14 amps time a good efficiency of 66% = 3.4 amps

I got news for you... tuned amps have been around forever!
The up side is better efficiency... the downside is narrow bandwidth and
inherent stability problems.
Dave has re-invented the wheel.

Radio shack finally built a good ham rig then the ARRL and FCC screwed
them with the restructuring.....makes a one band HF a lot less
attractive.They are good radios but lack CW,also watch power out on FM,
for some reason it will do full output.
NOT modifiable.

Saw your post on the newsgroup. I see you are in Ohio as well.
You said nobody in your area works on the tube equipment. Here is
a place in Ohio that is good on tube type amps. If you are to far
away you can send it in for repair or a free estimate. If they
don't fix it then you don't pay! They are quite fast on repairs
as well as keeping you informed on the status of your equipment.
Here is the website which has their email address and phone
number.......

www.bcity.com/dino

Charlie:

Are you using a "loaded" type antenna, such as a Wilson 1000, or any of the Firestik look-alikes? If so, the load coil may be creating a cap hat or floor at higher power outputs, which may raise your SWR readings. I have a similar "problem" with a Palomar Elite 400 on a dipole I run on my truck. It doesn't seem to affect my get-out... I was reported at 10 over today in San Diego, and I was near Downtown Detroit when I was talking with that other station (73's CA-30!).

Check your SWR at low power levels, and leave it at that.

-CGP

where is your swr meter located at? between radio and amp? or
between amp and antenna? it makes a difference.
if its at the radio then what your seeing is the amp's input
impedance. if its after the amp and the swr goes up with power
then you have a piss poor ground. probally at the antenna.

dave

I also have a look alike antenna and the range is very limited. I am unhappy with it because it was not cheap. The best I've found is to use a magnetic roof top that increases the range. I wish someone could invent one that does as good as a roof top.

Excuse me, but just where did you imagine that from? Uranus?

Stick to bitching about CB stuff and leave amateur radio to people who know something about it so you won't sound like a lid. There are rules on what can be commercially sold but that is completely different from rules about what a licensed amateur radio operator may use.

>SSB? I am interested in what is going on Thanks...

Alot of 10meter radios can be modified for the 11 meter (CB) band and most CBs can be modified for 10 meters. The advantage to using a 10 meter radio would be more modes of operation AM FM CW LSB USB more power (ie the HR2510 I had keyed at about 10 watts AM and swung to about 40. SSB has more power as well. I wanna say most SSB radios will do about 12 watts unmodified, but I could be wrong.) That's pretty much it really. I'm sure there will be others who can answer in much more detail if need be. Hope this helps.

Regards,
Jeff

> FCC type accepted. Part 97.315(b).

Read 97.315(b)(3)(ii)
etc.

And you might even want to read 97.315 itself to find that it talks about what "may be constructed or modified during any calendar year" -- in simple language it talks about building amplifiers, not about using them.

Likewise 97.315(b) which you incorrectly site, talks about what may be "manufactured, imported or modified for use" - again this is talking about making an amplifier or bringing one into the country for sale, not about using one.

Type acceptance is NOT required for use of equipment in the Amateur Radio Service by licensed amateur radio operators.

Why not give the real frequency range you want the amp for? If you ask
a technical question you should give real data. No one in this
newsgroup is looking for an amplifier to use on 28-29MHz.

Physically impossible. 27 MHz is a long wave and short antenna don't
cut it. If you want to be heard, you have to be extreme! No really,
a well grounded antenna is the secret. No ground plane antennas are
also a waste of money. While there are better options then a Wilson
1000 magnet mount, that is an option that will work.

Hi Kyle,
I tried the radio shack version of through the glass, and it was junk as far as for a cb. I trimmed it to the proper length (about 4 ") for 800mhz and now use it for a scanner antenna. I had just purchased a brand new ford crown vic and didnt want a big gaudy set up so I did like you. Now I have given in and got out my trusty wilson lil' wil magnetic trunk mount.....no way around it.......sorry.
If I can help you on installing advise let me know.

People tend to buy 10 meter radio's,because they can be converted to
illeagly use on 11 meters,most radio's of that variety come easy to
convert,a lot of folks have found the 40 channels way to crowded for them
and have chosen to risk federal fines and crimminal charges,talking above
channel 40,I know all this is redundant to the ng, but as a new operator you
need to know,it seems you have internet capabilities and would be to your
advantage to search around a bit, there are some very explanitory pages up,
that way you can know what all your getting into, as for the mickey mouse
noise,that is what your clarifier is for, learn to use it, and ,you can also
see the varience in freq.in cb gear,good luck, learn as much as you can, and
most of all,have fun

That's because possibly the others are off frequency a bit. Or the main one you've tuned to is off. Just turn the RIT control and you can hear all as needed.

Hey Tim,
Have you ever owned a Sidewinder 400? Even when I'm on the regular legal 40 channel this doesn't happen. I run one Sidewinder on the base with power tapped from my Uniden PRO810e using an A99 and one mobile with an Antron 1700. I get more splash with my Uniden than with the Sidewinder!!! You must be one of those guys who payed $300+ for an RCI2950 or something like it and your whining because Sidewinder 400 users have a radio thats just as good and we only spent $129!!! Even if you add a Palomar 225 from Coaxkid and an Astatic 575, the total only comes to $270, still under what you payed for the 2950!!!!!

2990. Re: How to remove talkback on a Galaxy 99v ?

On the 99V,turn the echo off,mine turns off the talk back at that time,echo
does nothing to enhance your ssb signal but distort it,think you'll find
that most ssb'ers wont talk to you or ask you to shut it off ,if you happen
to forget it on, the 99v's have an excellent sound on AM, with a bit of echo
turned on ,but on ssb, because your signal is all controled by
modulation,they sound lousy,good luck and 73's

2995. AH506m & Eagle Spitfire 454 Titan Dragon 10m handhelds

Newsgroup: rec.radio.cb
Date: 2000-03-03 00:00:00 UTC
From: mp <mplanck@my-deja.com>
Message-ID: <89p365$tc1$1@nnrp1.deja.com>
Source record: 25636
Cross-posted to: rec.radio.cb,rec.radio.amateur,rec.radio.amateur.misc,rec.radio.amateur.equipment

Hi!

I understand the whole point of (most) mods; the manufacturer has designed in certian features and then blocked them out in certian versions of the radio, to accomidate different bandplans, etc in different countries.
I'm not specifically questioning "why cant I TX from 25-32 mhz like my 2950", I'm merely stating that there are a LOT of jumpers in the radio and there are probably a lot of different options that could be enabled/disabled. I am wondering if anyone has a list of the jumpers and what they do, OR knows where to get a service manual for this radio. Copper sells a video tape covering the mod. Im wondering if anyone has seen it and if it just covers the 25.165 to 29.700mHz mod (like the Cherokee AH100) or if it covers each of those little 'jumpers' and what they each do.

Also I am very interested in the AH-50 and AH-50SF 6 meter HTs from Cherokee. I performed mods as indicated below and nothing happened!

I've found it difficult to deal with Cherokee, (Wireless Marketing in Schaumburg IL) and impossible to find Maycom, the original overseas manufactuer of these units. Has anyone ever seen a service manual for any of these units? (AH-27, AH-50, AH-100....?)

Thanks.

You can have the best recieving radio in the business but, if you just run it thru a coat hangar, it's not gonna get it... Get a decent radio and the best antenna you can afford.. Or make yourself up a decent dipole for base use. I run a dipole called a G5RV here in Alaska and have talked all over Europe on less than a hundred watts. It's a lot cheaper to buy a better antenna than it is to buy a big ole amplifier and you get more benefit out of the antenna than just increased transmit.. You also increase your recieve capabilities..

I personally run an RCI 2950 with a Ham stick 10 meter antenna in my truck and it works great.. It's had a few mods done to it and they do a lot to improve the functionality of the radio.. Easy to do, just move a jumper or two.. No solderin, no cuttin.. Easy as turning knobs and pushin buttons..

Good Luck

Hello! Please see my other post in reply to this. I just pulled my Eagle 454 out of the box and checked- you are wrong, when I hit the 'step' button I can choose 1,10,100 khz steps. Right out of the box- I did no mods to this rig (yet!)

I checked your website- it's pretty good. I have a question- on your 10m page, what's the difference between the "Titan I- the Titan 201" and the "Titan Road Pro". I noticed your picture of the Road Pro is Copper's picture of the 454-from their website- with the name blacked out!! Next time I'm down NJ way I'll stop by with my digital camera and take some good pics for you! :D

Seriously though- as a dealer, do you have any access to a service manual for these radios? Obviously they are all made in the same factory so a Titan manual should be the same or similar as the Eagle. If you have any contacts with the factory I'd like to try to contact them directly (although I dont know how useful a Phillipino manual would be!)

P.S. My freq counter doesnt go below 30 mhz so I cant verify this- does the clarifier on the eagle/titan track (change frequency) on transmit also? (I guess I could use another CB to see...)
I actually found a mod for the AH-100 to: Unlock clarifier and add FM compatibility but it refers to parts I can't find inside the rig. I think it may be a mistake.

Thanks Tim, and the other poster. No, I don't want to join,(although it appears I meet the criteria) I'm sort of an independent radio station. Just trying to track down a feller I used to talk to on a regular basis out of Belgium. I wrote to him and got no response. Just curious if he's still around. Thanks again! Much obliged!

3005. "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-03 00:00:00 UTC
From: Charlie M <cmcmanus@twave.net>
Message-ID: <idVv4.87343$ox5.23232110@tw11.nn.bcandid.com>
Source record: 25646

I have a "Boomer Deluxe 400" made back in '97 that has the four mrf455 transistors. The amplifier works and sounds okay and power output seems to be normal except for the high SWR seen at the output when fed into a properly matched antenna. The reading goes to about 2.5 to 1 with the amp on. Apparently, it is putting out harmonics. Since my experience is minimal with these units, What is the most likely component failure that would cause this symptom? It didn't do this originally. I know there are trashy amps on the market that do this out of the box. This one wasn't that way. There are no physical signs of any component failure. Any suggestions? (besides throwing it away of course!)

I have noticed a lot of amps doing this type of thing and would like to be able to fix them!

Any useful comments would be appreciated.

Charlie...

I took a look at the web page. Very impressive. The guy had 7 typos in
the two-paragraph home page. If this is some indication of his level of
precision in designing and assembling an amp, well ....

yeah, hehehehe don't key the damn mic ,leave it on the mic hanger. why in
the hell would someone buy a radio with talk back and then remove it ? i'll
tell you why because you have had your damn fingers in the radio and now it
squeels like a damn pig, but seriuosly if you get your radio to modulate at
no more than 100% you will still be loud and be able to hear yourself to.
galaxys sound like shit overmodulated anyway. also keep that d-104 away from
the radio,another reason you'll squeel or feedback.

3030. Eagle Spitfire 454 Titan Dragon 10m handhelds

Newsgroup: rec.radio.cb
Date: 2000-03-03 00:00:00 UTC
From: mp <mplanck@my-deja.com>
Message-ID: <89nqva$vh6$1@nnrp1.deja.com>
Source record: 25671
Cross-posted to: rec.radio.cb,rec.radio.amateur,rec.radio.amateur.misc,rec.radio.amateur.equipment

Ok, so I have an Eagle Spitfire 454 from Copper- I know the mod that makes the frequency coverage just like the Cherokee AH-100 after mods, 25.165 to 29.700mHz. However, if you've opened the rig you know that there's like 10 different solder points there that could be bridged or open. I'm wondering what these other ones do. Why can't this radio open up from 25-32 mhz like the 2950? Is there a mod to make the clarifier track on transmit as well? How about getting rid of that HORRIBLE keypad beep? Is there a mod to step in 1Khz steps rather than 10? There are enough solder pads there for a whole bunch of different mods. Any way to get a service manual for this rig? Or sources for the other clones? All I can find is the Eagle and I've never personally seen the Titan and Dragon versions....

Also- this may not interest anyone here in CB land but I also have a Cherokee AH-50 SF, its a 6 meter handheld rig. It has four open solder pads inside, and two empty holes with a diode picture silkscreened on the PCB. I bridged all four solder points and put a diode in the holes where indicated. Nothing happened. Does anyone know of any mods for this rig or a way to get a service manual?

I again disagree. The 510/520 have very poor (cheap) rx sections in comparison to the 68XL. The 510's etc. pick up much more hash and motor noise than the 68 and is only $35 difference.

Wm.

your problem is more than likley in the relays, they could be
just dirty, if not then the keying transistor is shorted out
causing it to stay keyed and not returning back to recieve.

dave

that...Why can't this radio open up from 25-32 mhz like the 2950? Is there a
mod to make the.....Is there a mod to step in 1Khz steps rather than
>10?..... I've never personally
>seen the Titan and Dragon versions...."

The Titan, unlike the Copper radio does the 1Kc steps right out of the box.
As far as 25-32Mhz & other "mods", the radio has to have been designed &
"burned in" for these functions at the factory & then "blocked". "Modifying"
any modern radio like a 2950/Titan/Yaesu/Galaxy/Scanners/Connex/Alinco etc, is
really Actually "UN-modifying" it, to restore the original freqs&channels
designed into it by the factory before they "blocked or modifyed" it for the US
market. I'm pretty sure the Titan & similar don't have the ability to display
or generate freqs between 30-32Mhz "hidden" & blocked in their chip.....

I purchased a long range cordless phone quite cheaply at an auction.
It used 31 and 51 Mhz and put out 4.5 watts from both base and handset.
It also came with a 30 watt amp for both base and mobile use.
I had a lot of fun with it for a while.

I did that, and connected it to a rooftop antenna approximately suitable for
the 30 Mhz that such cordless phones used, and got almost zero range.
BTW, have you ever considered trying upper case?

At 30ft you will not need any cement. Dig a hole about four feet deep and anchor the tower to the roof. If you must have a freestanding tower, I would be inclined to go much higher than 30 ft.

IMPORTANT INFORMATION!!!! ALL OPERATORS ON 27.555 TAKE NOTICE! THE IDIOT NAMED "BOB" HAS BEEN LOCATED!! HIS REAL NAME IS KINGSTON. HIS ADDRESS IS 4002 E. LEWIS ST. PHOENIX,ARIZONA 85008. IT IS LOCATED ON THE CORNER OF 40TH ST. AND LEWIS ST.(N.E. CORNER). WHY DON"T YOU ALL SEND MR. KINGSTON A LETTER AND LET HIM KNOW WHAT KIND OF SCUM HE REALLY IS. OR, MAYBE SOMEONE WOULD LIKE TO GO OUT TO PHOENIX AND VISIT HIM. HIS TIME IS BECOMING SHORT. LET EVERYONE YOU KNOW HAVE THIS INFO. THIS IS 100% CORRECT.

3070. FS:HIGH POWER TRANSFORMERS FOR TUBE AMPS

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: jimmoci@aol.com
Message-ID: <20000303215736.14767.00000059@ng-fg1.aol.com>
Source record: 25589

I saw some big Iron listed for sale and figured I would list some of the big stuff that I have laying around. It is located near Philly and is pick up only.

(2) for sale- 4000 VAC with a center tap- 2.1 amps continuous, 175lbs, see pic @ http://members.aol.com/jimmoci/trans.jpg Yes, thats a 3-500Z as a reference for size in the pic. These transformers are from 5KW HF Jammers used by the military. $250 each

(1) 5000VAC @ 3 amps CCS from FM Broadcast transmitter- 250lbs Sorry-No pic $450

(1) Pole Pig Transformer- 7200 VAC with a center tap - 150 lbs - Not sure on current rating. $125 See pic @ http://members.aol.com/jimmoci/polepig2.jpg

(1) 3200VAC @ 2 amps from broadcast transmitter - old and ugly but works good, Sorry- no pic. $125 Around 90-100 lbs.

Thanks for looking,
Jim

The talkback mod on the GalaxyRadios website will also give you clean talkback
and echo on SSB.

3084. Re: "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000304031830.15491.00000214@ng-de1.aol.com>
Source record: 25703

The high SWR could very well be a false reading caused by harmonics. I had a 2 pill Boomer that did the same thing.Borrowed the spectrum analyzer from work and checked the amp with it. Found the second harmonic was only about 15db down from the fundamental. Fiddling with the bias circuit got hte harmonic down to 40db below and SWR reading like it should. If yours is anything like mine was there is no adjustment for bias and you just have to change resistors until you get it right.

I don't think you fiddling with the bias and the reduction of harmonics was the cause of the SWR enhancement... however... your bias change would definately have an effect on output impedance of the devices in question. That would certainly impact the match...

I think the gentlemans original problem is the lack of proper impedance matching when the unit was made. This is very common for those bootleg units that are literally "thrown" together. I recommend he take it to someone with RF tuning ability for a dial-in...

3090. FS:RS DX-394 HF receiver with MFJ active antenna

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: manytrails@aol.com
Message-ID: <20000304083249.02364.00000380@ng-ci1.aol.com>
Source record: 25709

Both units mint and working perfectly. Comes with original boxes and instructions. The active antenna also has the optional AC supply. A great combination. The radio is rated four stars for value by Radio Netherlands. Additional info on radio with user report and extensive tech data:

http://www.rnw.nl/realradio/dx394.html

The MFJ 1020B active antenna is very highly rated also. For in depth info on it check out this site:

http://www.mfjenterprises.com/antennas/mfj1020b.html

Here is a photo of these items:

http://members.aol.com/manytrails/pictures/394-best.jpg

Price for this combination is $225 shipped and insured to your door. No sales outside US please. Email if interested.....Thanks....Bill

3091. Re: 10 Meter Radios

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: qrm2000@aol.com
Message-ID: <20000304082837.15355.00000772@ng-df1.aol.com>
Source record: 25710

>Is there an advantage to using a 10 meter vs a regular CB with
>SSB? I am interested in what is going on Thanks..

In addition to the other excellent responses you received, let me add:

Learn as much as you can about frequency management and assignments. Any time you stray outside the regular 40 channels of CB, there is the potential to cause harmful interference to other radio services. This is especially true as you go below Channel 1 (radio station remote broadcast linking frequencies), and above 28.0 MHz (Amateur radio frequencies). It is very possible to be causing interference without realizing it. You may not be picking up traffic on an individual frequency because it is weak, or you are in the wrong mode, or they are using split frequencies (transmitting one place; receiving on another).

A significant problem exists when you use a 10-meter radio which does not have a frequency readout; only BAND and CHANNEL knobs. You should obtain a conversion chart from the Seller or from a CB shop and make a note of which BAND/CHANNEL combination takes you above 27.995. Keep your operation LOWER than this and there is a good chance you will stay out of trouble.

Hint from the battlefield: Those who get shot are the ones who stand up and yell, "Hey! Look at me!". Keep a low profile on CB. Don't annoy the neighbors by blasting over their telephone or television programs. Don't annoy the other CBers and Hams in town by running a "dirty" radio with splatter. And don't transmit on any frequency where you are likely to get instant attention from those who have an FCC license to use it. They can be real possessive!

>From: AB7RS tglenn@imt.net

> "Radio shack finally built a good ham rig then the ARRL and FCC
screwed......."
??? Radio Shack Didn't "build" anything, they merley "private labled" a
radio that was already being made in the Orient, as they do with most of their
products. (the radio was being sold as a Magnum 257 & superstar 4900 long
before any RatShack store ever saw one..) They did however, finally get the
price competitive, unlike their other attempts at priceing their off-brand ham
gear (I still laugh at that quarter-watt keypad & battery-less $79 2M HT they
market for $180, almost the price of a 5W fully programmable w/batt dual
bander!) As far as the FCC "screwing them", I'm sure from THEIR point of view
making HF licenses easier to get can only mean MORE sales for them & their 10M
rig, & they would be the ONLY MFGR or retailer of Ham gear in the world that
thinks this new ruling "screwed them".....

Paul,
I believe that no one wants to stand up and say that this man is interfering on a band that is illegal to transmit on. This would imply that they, themselves are attempting dx contacts on this illegal frequency and "freeband".
Besides. someone named Paul4131 who says the info is 100% correct is an unknown source, possibly fingering the wrong person for personal reasons. Stand up and take credit for the info, do something yourself, or just don't worry about it. He'll probably ge tired of it. I kind of enjoy listening to him and the mess he stirs up with the politically correct, yet still illegal "freebanders" on that frequency. The duckman dude is pretty darn funny, too.

Billy Bob

Both units mint and working perfectly. Comes with original boxes and instructions. The active antenna also has the optional AC supply. A great combination. The radio is rated four stars for value by Radio Netherlands. It is rated three stars by "Receivers-Past and Present".

Additional info on radio with user report and extensive tech data:

http://www.rnw.nl/realradio/dx394.html

The MFJ 1020B active antenna is very highly rated also. For in depth info on it check out this site:

http://www.mfjenterprises.com/antennas/mfj1020b.html

Here is a photo of these items:

http://members.aol.com/manytrails/pictures/394-best.jpg

Price for this combination is $225 shipped and insured to your door. No sales outside US please. Email if interested.....Thanks....Bill

3100. Re: "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: Charlie M <cmcmanus@twave.net>
Message-ID: <xM9w4.89225$ox5.23719863@tw11.nn.bcandid.com>
Source record: 25719

Sorry, apparently I didn't make myself clear with all the details. Here they are:

The amplifier is on the test bench. It operates fine into a resistive load. The power / swr meter is connected between the output of the amp and the antenna.
The antenna in use is simply an A99 whose swr at the frequency in test is 1 to 1 (nearly immeasurable) as long as the amplifier isn't operating.
The power supply is more than adequate and the ground is not an issue.
There is not a break down problem with the feedline or antenna at high power levels, other amps with higher power have no problem.

As soon as the amplifier is engaged, the swr goes to about 2.5 to 1 (yes the fwd pwr is recalibrated on the meter, the reading I am getting is accurate).

I am sure that the output is laden with harmonics. I am curious as how to eliminate this type of problem and was hoping someone knowledgeable with past experience in curing this problem can help me. I have a Motorola service monitor with a spectrum analyzer on it. I can see harmonics but am looking for the most likely cause without spending the rest of the month experimenting in the wrong area.

The swr decreases with the unit on high power to a usable 1.7 to 1 or so. This amplifier selects power levels simply by changing the padding resistor value at the input with a switch. I know that this is a common way of giving power level selections on these cheap units. It also presents a change in the load on the radio. I am not concerned with the swr at the input of the amp, it is not causing any radio attached to generate the harmonics. Any suspicion in that area would be invalid. I am just concerned with the output and what is being radiated besides the desired signal. I have gotten some interesting responses so far and appreciate them. I am always looking for any additional constructive input.

Thanks to all!

Charlie M...

Wilson makes what they call a "short load" stinger that replaces the standard one. It is 39" and has a load about 2/3 the length and tunable. I use them with the 1000 and with the Tucker 2000 and they work fairly well. I have one 2000 with the short load and using my MJF 259 it can be tuned right down to a near 50 ohm match.

Hope this helps Stan KYA 4011 747 Mojave Desert So Cal

any time you have more voltage passing throught wire,the swr meter acts as avolt meter,picking up a higher voltage.leading you to beleave high swr. most swr meters are rated 4 watt input no more no less. if your swr is good with 4watt input thats all that maters .the high swr or[500] watts you see after the amp doesnt mean anything

hello. I drive a Cummins computerized engine truck and am having alot of interference on the receive side.
should I run a filter on the power leads or is thhe problem with rf from the ant leads??
when I park and shut the engine off my mirage 88 works great so I know that the problem is the engine.also I run a Wilson silver load antenna.
also the radio has a good ground etc.
thanks in advance
lumpy

Griffey, better efficiency is what anyone who uses an amp looks for, and narrow bandwidth is the desired choice for the people who use his amps more power where you want it you have helped promote the benefits of this amp. Please post a link to another amp that resembles this one let alone a cb amp...

Perhaps we can see your verson Griffey?/ Why wouldnt anyone want
better efficiency?? Also narrow bandwidth puts the watts where you
want them it is a very clean and stable amp if you know how to make
one. Perhaps you can post a link of similiar amps like this Has this
wheel ever been used on cb band I highly doubt it. Your still a loser
Griffey.

I think you need a better receiver. The band is full of rare DX, nets, repeaters, etc.
Truckers make up maybe 2% of the operation on 10.
Steve
btw: the legal truckers on 10 are pretty good operators.

Message-ID: <9gdw4.89568$ox5.23830953@tw11.nn.bcandid.com>
Source record: 25754

Class C will only have a different sound if you are attempting to use it for SSB use or on AM if your carrier input is insufficient to bias the amplifier "on"... Otherwise you will not be able to tell the difference. Remember that class C (no bias in this case) has significant advantages if you can take advantage of them! It allows much better operating efficiency... allowing use of smaller heatsinks for a given power level as well as keeping the internal transistor die cooler therfor increasing reliability. It can be used with excellent results on AM and FM but since SSB has a supressed carrier... it's not recommended for that mode.

Source record: 25758

April 15th is fast approaching! Get those yummy ham
tickets and head on up to the land of greener pastures!
1500 LEGAL watts can be yours to talk around the world and
harass a much larger audience with your wit and charms.
Imagine being able to have thousands of channels to talk to
the fellow hams around the world, being welcomed at
hamfests with your new "ticket" and having the honor of
being called "Welfare Ham" at every table. My gosh I can
hardly wait to get mine!

3140. Re: Top secret Dave Made Amp

Newsgroup: rec.radio.cb
Date: 2000-03-04 00:00:00 UTC
From: Brian Griffey <bgriffey@kwom.com>
Message-ID: <sqdw4.89629$ox5.23835122@tw11.nn.bcandid.com>
Source record: 25759

It has nothing to do with not wanting better efficiency... I'm all for that! It's the instability problems that come to get you in that type of design. The TNT line of bigger amps(TNT1200 for sure) use this tuned scheme and are VERY unstable! They start to oscillate at the drop of a hat. There are methods to tame this tendancy in oscillation that involve increasing negative feedback and de-Qing tanks... but I saw no evidence of such circuitry on Dave's proto photo. That amp may work like a million bucks when running a non-inductive dummy load but may go absolutely nuts when the load has even a small reactive component...

I agree... it was no joke. The type of amp Dave is attempting is design is difficult at best. I give him credit for trying! I just caution him to do extensive testing with reactive loads to ensure stability before a design like that is put "on the street".

If you're getting any power output on a power meter in SSB without any modulation... something is definately wrong!

Could your mic or audio stages be oscillating?
What does the transmission sound like "on the air"?

This is probably "the" most reported problem in mobile operation. The first step in solving this problem is to determine where the vehicle "noise" is getting in the transceiver. Is it coming in the antenna or the power lead? Hopefully it's coming in the power lead... this is by far the easiest to fix. To make a determination... get the noise nice and noticeable and then disconnect the antenna. Did the noise go away or greatly reduce? If not your lucky... that means the noise is coming in on the power lead. If the noise is virtually gone... obviously it's coming in on the antenna. Make this test and report back for further instructions.

Hey prozac, I did this over a year ago, It works ok, but not worth all of the trouble. One pill or a two pill maybe but I would not bother with an eight pill, Dave was probably just bored. I can tell you this though, he did not in no way invent this design. It works on the same concept that your cb radio does, it is a tuned circuit, that's all. It is not really that big of a deal.

Impedance of the amp has nothing to do with SWR. SWR is the sole product of impedance of the load and impedance of the trasmission line. Since the antenna is a poor match to the harmonics they are reflect back giving the high SWR. AS to how bias effect harmonics: The nature of a puh-pull amplifier is that it cancels second harmonic distortion, however this does not work so well if each side is not in balance with the other. He should also check it and see if it has ever been worked on. If the finals were not replaced in pairs they may be so out of balance that it is causing excessive 2nd harmonic distortion. Of course overdriving it and inputting a distorted signal into it could also cause a problem.

Question, how are you going to take a signal @ 50 ohms and input it into a couple of ohm device with out transforming it down one way or another? You need a transformer, plain and simple. It may not be the conventional solid state method of wrapping wire around a ferrite core, but it will be a transformer of some kind none the less.

So true. All I can add is don't purposely try to piss off other operators. Too much of this going on lately. We all have more in common than we do different but you'd never know it by the attitude of some stations.

John, it could be that your microphone is picking up the transmission and creating a feedback problem. I'm not familiar with that radio but can you crank the mic gain down to nuthin' and see if that stops it? If so, the problem could just be an antenna placed too close to the radio. Or a mis-wired microphone etc. It would definitely take it from -major- problem into -minor-.

A piss poor one if you intend to illegaly use a 10 meter rig as a CB.

Of course the rumors are true,get the 2950 and leave it stock,although
they are not meant for 11M the new DX version does 10 and 12.

From: castle222@webtv.net
Message-ID: <13435-38C18380-61@storefull-137.iap.bryant.webtv.net>
Source record: 25785

A friend of mine just recently bought what looks like a base station linear amplifier, it is gray in color, and says dbx on the front, with the name 'phantom' on it. The old guy that sold it to him said it was his son's, and he didn't know what it was, (or what it did for wattage). ALL that he did know about it is that "It used to tear up the TV somethin' terrible". It looks like it has 10 tubes inside it, but when we plugged it in...It makes a humming sound when its on, and it gets REAL hot!!!! o ya, It only does about 200 watts swing on a Dosy.
I told him it needs tubes, but I don't know what kind, because it looks like this thing was sitting in a garage on a shelf for a long time..and you can't read the ID # on the tubes its so dirty.....
Please tell me what this thing needs to be 100% again, and the kind and number (I think its ten, but maybe i'm wrong!!) of tubes it needs.
What should this thing do on a wattmeter?? Is it worth fixing??
He only paid $25 for it......

Thanks for the help.......

The Armenian judges gave it a 9.8 on the Olympic Troll-O-Meter,
but they were over-ruled by the umpires in instant replay, who
award it a 2.6

The Armenian judges lodged a formal protest!

It was sufficiently trollish, of course, but way too obvious.
It was poorly written, poorly executed, and was so incredibly
lame as to lack the true drawing power of a really masterful
troll. Maybe as high as a 3.3 for the sheer stupidity of the
premise, but a 9.8? Never! The Armenian judges tear their
hair out, throw their balalaikas down in dismay, and perform
the traditional Armenian Dismay Chant! They demand a recount!

Regards,

Hans, Lord High Keeper of the Troll-O-Meter

I have got an Eagle Sidewinder 400 10 meter radio that i just started using with an Astatic 575 M-6 microphone. The radio has a small hum while in transmit mode with this mic, though it did not have any hum with the stock mic or an RF Limited power mic. The hum is low level...and only while transmitting, and when i touch the back of the radio it stops completely. The microphone is wired correctly...and the audio from it is very loud and clean. The blue wire & the shield are twisted together and soldered to pin 5 as called for. Any idea's ?? Thanks

It's a Phantom 500 by D and A

Probably four tubes feeding six. There where other configuration of this but all of them use TV sweep tubes that are very expensive if you can find them. The 500 should do 800 or 900 watts carrier if you push it. They were rated as 500 watts average and 2000 watts PEP

Don't bother trying to fix it up. It's just to expensive to retube and to dirty anyways.

So your "tuned circuit" is essentially a xformer right? That was Prozacs post, that Dave was prototyping a amp with no transformer. If there was no transformation taking place the transistors would go poof!

Prozac,
Man don't take it like that man! I was just pokeing fun at you. The
fact is dave is not wasteing 8 2879s he is on the right track to
building a serious compition amp. There is nothing wrong with it or you
being a good friend. Cb is all about fun! as far as the post about the
wheel there have been lots of improvements made since it was invented.
If ever took the old why try attitude then no progrees would ever be
(dave)made LOL. I believe that Dave is building the best
amps right now. I am a proud owner of a Dave Made! I like your site
prozac I am glade you post things please keep up the good work. Dave
has nothing to prove his quallity and workmanship have already left his
mark.

I would not be surprised if Radio Shack comes out with single-band 20
and/or 80 meter units to take advantage of restructuring and all the
newly-minted Generals and Extras. These would be inexpensive HF radios
which could sell even when the sunspots are no longer favorable.

can't you tell jive bait when you see it?

The proper response, since you felt compelled to answer, would have been
"Cut the Red/Black wire coming out the back of the rig"

charlie bravo??? ho ho -- just what we need 10-4

Sounds to me like it needs about 30 fathoms of water on top of it. Do the radio frequency spectrum a favor and keep it on the shelf as a curiosity, dust it occasionally with a damp rag, cut the cord so the cat doesn't pull it down off the shelf, and pat yourself on the back, thanking yourself for taking such a nasty emanator of spurious emissions off the airwaves 'Nuff said.

If you want quality ssb, don't get a galaxy, and whatever you get, don't get it "peaked and tweaked" by your local golden screwdriver technician, or your ssb will always sound like crap.

asx an owner of one of these. I can give a truthful, unbaised opinion.

They're great on transmit. will blow a galaxy 88 away stock, as far as deadkey goes. But audio in them is not as good as galaxy's. The recieve in the 2510's is very loose. meaning if someone is near you running power, you won't be able to hear yourself think. But hearing in the distance is awesome.

Don't know on the newer lincoln's... never owned one. I would like the mod's for these and the jacksons and grants, if anyone has them, please send them my way.

there you go!

Hi,

I was tuning the CB band yesterday and at around 27.700MHz USB and I heard an SSTV signal. I looked at the picture with my software and got some decent picture quality. If anyone wants to listen to SSTV and you have a computer with a soundblaster compatible card, and a radio that can tune 27.700 you might want to see if you can see the pictures too. You can download the software at http://www.siliconpixels.com

I use the W95SSTV program since the ChromaPIX program times out after 15 minutes unless you register the software.

Also, they were using the Martin S1 mode, so you have to change from Scottie S1 to Martin S1 to receive the pictures properly.

Remember it's illegal in the U.S. to transmit SSTV on CB, but it's fun to listen and see pictures sent by others.

Bob

RCI: Pin #:
1. Ground
2. Audio
3. TX
4. RX
5. Channel Up
6. Channel Down

HandHeld D-104

shield & blue to pin 1
Red to pin 3
Black to pin 4
White to Pin 2

The color on the mic for the audio wire may be yellow and pin 5 & 6
may be backwards but this will get you in the ball park. Done off the
top of my head so dont bitch!!!

Source record: 25854

What!
The source and the load impedances govern the match... and therefor the SWR(standing waves) on the line!
From your statement here... I feel that you are unclear about what standing waves are and have contradictory statements in adjacent sentences. Standing waves are created due to a "mis-match" condition. The amount of standing waves on a line directly relates to the mis-match. In other words... like I said before... SWR has everything to do with impedance matching!

3236. Very low price offer on the RCI 2950 CD-ROM

Newsgroup: rec.radio.cb
Date: 2000-03-05 00:00:00 UTC
From: Philippe Cadic <ph_cadic@wanadoo.fr>
Message-ID: <38C25716.6E37A280@wanadoo.fr>
Source record: 25855

SPECIAL OFFER (FAX ONLY)
ENDS: MARCH -the 6th

Dedicated Toll Free Fax number: 1-800-636-6051

RCI-CD ROM : $14.95 US instead of $35 US. (Includes shipping). For one CD ordered, we give one free (same address)

Over 350 Mb of pure technical information on the RCI2950, 2970, 2980, 2990, Saturn Turbo, Sommerkamp DX2000, Mirage 2950, Hercules, and similar rigs are hold by this small 12cm diameter piece of plastic. You have tutorials, audio explanations, video tutorials, alignment chart and much much more.This CD-ROM is now a success all over the world. It is a product that is 100% in english language for your pleasure only.

1.CB Frequencies charts, USA, UK, Europe...
2.10 Codes, Q Codes, Cb Language tutorials
3.Glossary of CB words and technical terms
4.The Mike encyclopedia (to wire tons of mikes with no problem)
5.Signal / Radio readability charts and explanations
6.For DXers and directional antenna owners, thousands city coordinates (lat/long)
7.Electronic tutorials, resistor color codes ...
8.Over 1500 mods covering ham radios and also CB radios (uniden, cobra, galaxy, kenwood, yeasu etc etc....) All by alphabetic order.
9.RCI Schematic diagrams (gif, jpg): boards, diagrams, component locations....
10.Voltage maps for repair actions
11.RCI 2950, 2970, 2980 etc.. modifications. Most of the modifications are the ones of the RCI BIBLE reviewed and updated for the RCI-ROM. Please click here to see them. The CD holds more mods than the Bible does.
12.RCI 2980 modifications in detail. (Note that most of the RCI 2980 mods can be adapted to 240 ch rigs such as SS3900, SS360, Pluto ...) + Schematic diagrams.
13.RCI Federation documentation: RCi newsletters ready to be read. Logos and music of the RCI Federation + letterhead word models... and much more.
14.Full Diagram: Main Board + CPU board + Microphone Encyclopedia
15.Full listing of all the components Full table of voltage values
16.Full table of frequencies - channels
17.Full alignment procedures
18.Repair tricks, errors, enhancements...
19.Plenty of mods with photos, videos, voice explanation....
20.Extreme mods "for transverting to other bands" chapter

21.A full DX Guide with beaming utilities & programs
22.A Rci Packet chapter: How to practice Packet with your rig
23.A complete information on the RCI Federation, the full collection of already published RCI Newsletter...
24.The RCI BIBLE 3.0 beta (exclusive)
25.A fully browsable copy of the RCIWEB + RCI questio board. You do not need any modem to browse the CBRom's web site.
26.Almost 100 Mb of nive quality mpeg video files which show you more about your RCI and its mods

Component section ID
Internal Controls ID
Channel conversion on new 2950, my old one got stolen.
MRF477 intro and removal of 2SC2312's
MRF477 pin reconfiguration.
MRF477's installed and AMC transistor location.
Observing the radios output on a scope and wattmeter.
Introduction of the Heavy swing modification.
Candlewax (just watch it!)
Observing the effects of the swing kit modification on the
Wattmeter and scope.
Disassembly of the radio.

Do we need to say more about the RCI-ROM ? It has almost all you are looking for, maybe more....

System requirements

- Win95/98 or NT4 (OSR2) with MS ActiveX installed. You must be able to read mpeg files.
- 8 Mb or more Ram - 10 Mb of HD - 800x600 or more video mode - A 4X CD-ROM player or more
- A sound card

SPECIAL OFFER (FAX ONLY)
ENDS: MARCH -the 6th

Dedicated Toll Free Fax number: 1-800-636-6051
The RCI Federation , New-York Office

RCI-CD ROM : $14.95 US instead of $35 US
if this order is faxed to our office.

My limited experience has been with cobra and uniden. Tried a cobra was unable to supress the engine noise very well. Switched to a Uniden 76 and found the noise blocking is much bettter. The squelch seems to work better. Well thats my 2 cents.

>good cb for about $80??? also what about the 66xl
>any good?? what isa fair price for this

The 66xl and 68xl are much better quality for the $80 range compared to the
510.
Most dealers sell these for $75-90.

What I want to know is why is Prozac on Dave's tip so much? I mean he's jockin him like his bitch or somthin. Why? there's gotta be a reason.

Dave's boxes got it going on but there's plenty of working boxes out there as well. Hell just listen in on DX land and you hear a world of boxes and all of a sudden Dave Made world gets a little smaller.

I must admit with all this hype I am anxious two put one of his boxes to the test and see for my self.

You are the one who is unclear. I challenge you to find one credible reference that states that the impedance of the source has anything to do with SWR. SWR is an indication that load is not matched to the line, nothing else. Having a 1:1 SWR does not mean that a radio is matched to the load. This is an assumption we usually make though because we assume the output of our radios is in fact 50 ohms. This is one of the reasons that the maximum reading on a field strength meter does not always coincide with minimum SWR.The indication of a match between source and load is NOT minimum SWR, it IS maximum power output. If what you said were true when you tune the output of a final amplifier you should be monitoring the SWR when you do it instead of power output. Perhaps this is the way YOU try to do it. Please state what you think I said was contradictory.

Hi all,

I finally got around to doing some work on my website and have
added the section on Circular Polarization (after promising
it for over a year!). Since I know quite a few people are
waiting to read it, I thought I would post a "heads up"
here. Also, I added the ability to search the text
on the website, so you can quickly search for
your interests.

The Ultimate Guide to 11 Meter CB Antennas!:

New to CB's and I bought a 40 dollar CB for my truck.
Im a truck driver mostly driving between Hazleton PA and Long Island.
I never new there was so much about CB's besides simple truck-to-truck comunications.
Do people actually talk over long distances with a CB and whats the diference between CB and HAM.
Is there a web page I can learn about what can be done, it seems like an interesting hobby
Thanks in advance
Ken

Oh bullshit.

SWR is an acronym for Voltage Standing Wave Ratio...

How would you measure the VOLTAGE difference (ratio implies some sort of dif
ference) without a volt meter?

Your amp is showing higher SWR because it is a low quality amp.

All of the amps of that line are BS, and will show exactly what the original
gentlemen was complaining of.

The only thing that would require more bias voltage would be raising the pla
te voltage.

Since you can't raise the plate voltage, the bias is just fine.

Your an idiot.

However, I do agree, the Ameritron amps are a little lacking when it comes t
o the amplifier world.

Anyone out here know of this base CB? What is it and what can it do. Is it AM/FM/SSB? Just curious. Please email.

With my eyes, I have trouble telling the difference between an SMD
diode, cap, or resistor.

If you'd read the website above, Scott suggests a right-handed
polarization "standard" since if the TX is right-handed and the reciever
is left-handed (or vice versa), then there will be a drop of about 3db
tween the two sites.

Read his pages, Scotts work is awesome.

The original poster who asked "what do diodes look like" couldn't possibly tune a Tx, never mind
have a resonant antenna.

> > look like?

If you're upgrading to extra, you already have an amateur radio license and therefore should already be familiar with what a diode looks like and you should already know the answer to your question. Now, go away. We already have a bash-fest over legitimate amateur radio topics and don't need you to stir "the already volatile pot."

3322. FS Silver Eagle Power Mic

I have a Silver Eagle forsale. Excellent Condition!!! It's real LOUD!!!!!! I hate to let it go. Has a 5-pin plug for a Uniden Washington. Just put a 9volt battery in it and blow'em away!!!!! If you get this mic, you will not want another mic! This mic is awesome!!!!! Everyone that I talk to here in Georgia is always jealous of how loud i am. Wish i could keep it. Email for pic or any questions.

$70 bucks

Interesting!

I would say that removing the diode *would* add the SF function (variable offset function) except that I think that the SF radio was released significantly after the original AH-50. In fact, the manual states "The most frequently asked for improvement was variable offsets..." Anyway- give it a shot, I added a diode and nothing happened. I'd presume removing it wouldnt do anything either.

Do you also have the line of four 2-conductor solder pads? They are just to the right of the contacts for the F (function) and light keys. In fact they share some of the same PCB traces. I've bridged all of them and nothing seems to have happened...

Let me know
Thanks!

>giant cb channel 6,barf

I don't particularly care what anyone thinks of my doing this, but every ONCE
in a while I go on ten meters and just bust their balls. I never cared for that
crap anyway, just a call sign and then to the next. So I would go up there with
a few of my friends and just start shooting the bull. CB is still very much
alive, even on 10 meters. >:-D

Dear Charlie Troll, cut all the diodes -- they only block the current most of the time. If you're not sure if it's a diode, cut it anyway -- it's probably either a resistor (slows current down) or a capacitor (doesn't really allow any current flow), so who cares?

Now, after removing all those blockages to power, you'll have to replace them. I suggest getting an oxy-butane torch or something really hot and melting a whole lot of solder into the rig. Use acid core to make sure there's no cold solder joints. Play the torch over the rig for a minute afterwards to make sure the solder is properly spread, then cool it down with heavily salted water. You now have a rig that will handle a lot of power.

And please don't include rec.radio.scanner in future.

Ron of that ilk.

Message-ID: <q1Hw4.11648$iA5.74387@typhoon2.san.rr.com>
Source record: 25960

It depends on the transmitter of the phone itself. With it being on the 2.4 ghz, you have less interference from other radio transmissions. Very few items transmit on that bandwidth (now). In a few years this bandwidth will be as crowded as the 900 mhz is now.

"Beedman007" <beedman007@aol.com> wrote in message news:20000305200104.03544.00000582@ng-cn1.aol.com...

CB is simply a free radio-communications system between regular citizens. Ham radio, requires you to take a test and obtain the appropriate license for your operating needs/requirements. Most ham frequencies, except VHF or UHF are designed for distant (DX) or trans-continental communications. Although distant (DX,skip) conditions certainly DO exist on CB, I would say that CB is more for your 'regular Joe' type operator. MY 2-cents...

Rap the rat-tail methodically around a shish-ka-bob skewer. Then season it with you favorite spices. Cook over INDIRECT heat on your favorite Weber barbeque using mesquite coals. When done, drag it through a drop or two of A-1 steak sauce. Bon appetit!!! Follow with a nice bottle of Samual Adams creme stout, or Northern New York's 1812 beer. Ummmm....

Yep, It is a real piece of crap amp if it was built anything like my 2 pill version. Seemed the biggest problem on mine was no bias adjustment. Had to do a little Southern Engineering and put in a set of matched transistors to get it right. This got the 2nd harmonics to a tolerable level, still took a filter to clean it up.

Source record: 25970

oh well in his absence here is one:

Once inside the bank shortly after midnight, their efforts at disabling the internal security system got underway immediately. The robbers, who expected to find one or two large safes filled with cash and valuables, were surprised to see hundreds of smaller safes scattered throughout the bank. The robbers cracked the first safe's combination, and inside they found only a bowl of vanilla pudding.

As recorded on the bank's audio tape system, one said, "At least we'll get a bit to eat."

The robbers opened up a second safe, and it also contained nothing but vanilla pudding. The process continued until all the safes were opened. They found not one pound sterling, a diamond, or an ounce of gold. Instead, all the safes contained covered bowls of pudding.

Disappointed, the robbers made a quiet exit, each leaving with nothing more than a queasy, uncomfortably full stomach.

The newspaper headline read:

IRELAND'S LARGEST SPERM BANK ROBBED EARLY THIS MORNING.

And another one:

This one actually happened at Harvard University in October of this year in a biology class; the prof was discussing the high glucose levels found in semen.

A young female (freshman) raised her hand and asked, 'If I understand, you're saying there is a lot of glucose in male semen as in sugar?'

'That's correct,' responded the prof, going on to add statistical info. Raising her hand again, the girl asked, 'Then why doesn't it taste sweet?'

After a stunned silence, the whole class burst out laughing, the poor girl's face turned bright red, and as she realized exactly what she had inadvertently said (or rather implied), she picked up her books with out a word and walked out of class...and never returned.

However, as she was going out the door, the Prof's reply was classic... Totally straight-faced he answered her question, 'It doesn't taste sweet because the taste-buds for sweetness are on the tip of your tongue and not the back of your throat."

No, you are not matching the line! I think this is where you are mixed up...
You are matching the impedances at the ends of the line... not the line
itself! The line should be transparent to the system.

> You are the one who is unclear. I challenge you to find one credible
reference
> that states that the impedance of the source has anything to do with SWR.
SWR
> is an indication that load is not matched to the line, nothing else.
Having a
> 1:1 SWR does not mean that a radio is matched to the load. This is an
> assumption we usually make though because we assume the output of our
radios is
> in fact 50 ohms. This is one of the reasons that the maximum reading on a
field
> strength meter does not always coincide with minimum SWR.The indication of
a
> match between source and load is NOT minimum SWR, it IS maximum power
output.
> If what you said were true when you tune the output of a final amplifier
you
> should be monitoring the SWR when you do it instead of power output.
Perhaps
> this is the way YOU try to do it. Please state what you think I said was
> contradictory.

I would suggest you post your request again. Only this time
make sure you say what you have, and what you're looking
for. And it doesn't hurt to put in a descriptive subject line as
well.

I personally don't know much about the TRC-431, although I
do have one (serial number 000001) but I don't have any
manuals or a schematic.

Jay,
The word "irate" is not a verb, first off. Secondly, in case you haven't noticed, the level of illiteracy is rather intense in this newsgroup, and I get a chuckle out of reading the postings that are placed in here by adults who display their levels of ignorance so proudly and publicly. Thanks for your contribution! Who needs Ice Cold's jokes when we have people like you?

Cross-posted to: rec.radio.cb,rec.radio.swap

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

Homer

When modified correctly the Galaxy 88 or 99.
The Uniden 76 can be tuned with larger final too and give them a run for the money.

Too bad they are teaching people in Texas how to read before they learn how to think.

For Sale:
Ranger RCi-2950
Nothing wrong with this radio, in fact it was only used for a total of about 5 hours at the most.
I got this in trade for some other computer related stuff and have no usefor it.
It has everything it came with new i.e. Box, manual, brackets, plug, mic, ??
I am in the Dallas area of Tx. and would prefer a deal in this area but will ship it outside
Texas if I get payment first.
The asking price is $200.00

Thanks
Scott.

3385. Re: "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-06 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000306152057.15546.00001354@ng-de1.aol.com>
Source record: 26004

Matching the line to the load is exactly what you are doing to lower SWR.Obviously you will not take my word for it nor would I expect you to. I suggest you refer to the Arrl handbooks, William Orr's Radio Handbook, or Joseph Carrs Antenna handbook or the FAA transmission line handbook. All say the same thing, SWR is soley determined by the load impedance and impedance of the tranmission line. Matching the load to the source improves efficency but does nothing for improving SWR. So far I have attempted to explain why position on this is true and give references. If you can not to the same to support your oppinion this conversation is over with.I will not waste my time on an "I'm right and you're wrong" argument.

>
>No, you are not matching the line! I think this is where you are mixed up...

I'm sorry I can't agree... The line is merely a means of getting the signal from the transmitter to the antenna(nothing more or less) and has distributed inductance/capacitance properties. It should be transperant to the system if properly matched at each end. The 50 Ohm impedance of the cable in question is a distributed impedance only and will appear transparent if the source and load are 50 Ohms.

Cobra/Palomar XL-450 4 Stage 12 Volt Amplifier

This ia a 450 watt 4 Stage Amplifier. Low, Med, High,
and Max. You can put up to 4 watts into this amplifier.
This amplifier can put out about 450 watts depending
on how much power you put in. This amp also has a
pre-amp and SSB mode. This Amplifier is made for Cobra
by Palomar. Anyone who has used Palomar equipment can
testify to the quality and performance of their products.
They are without question the unmistakable leader in this
field.

This Amplifier is Brand New and Tested.

$200.00 plus shipping

You can try adjusting the shunt capacitance on the out put of the amp, this may not fix it but it may help. look at it on your scope and see if there is parasitic oscillation when a lower carrier put into the amp. Also try a meter that truly checks the reflective power, like a bird 43. You can also try tanking the output of the amp. This may get rid of some of the harmonics you are seeing. I am not familiar with this particular amp. And I would worry about the input matching if I were you, it does have something to do with what you see leaving the amplifier.

From: AB7RS <tglenn@imt.net>
Message-ID: <38C4416E.4B3E@imt.net>
Source record: 26027

The main differences between CB and ham:

CB is limited to 2 modulation types(AM,SSB).Hams may use many.

CBers are limited to 12 watts,hams can use up to 1,500.

CB consists of 40 frequencies in the 11 meter band,ham is thousands of freqs in the 2,10,12,15,17,20,30,40,80,160MHZ HF bands plus many thousands of higher freqs.

CB range is limited to about 150 miles,ham range is not limited by law and can reach around the planet.

CB can be used for buiseness,ham cannot.

Hello Billy Bob: Good deal, I am glad your amused, this makes my day.

The word "irate" was again purposely put there to see if you would try
to correct it. You did! I am in laughter almost in tears.

I'll bet your one of those tight ass people who get all up set when your
in a place like HRO, and some gentleman comes in and asked if the
linears will only do a mere 1500 to 2 grand, I love it.

As far as the level of illiteracy in this or any of the other
newsgroups, you bet it may not be the level you would want to send to
the Paris Air Show, but then again most all technical people write this
way. Just about all the great scientists and engineers write with a
atrocious writing skills. The only ones who correct technical papers and
such are securities. You would have a ball over on the all the other
rec.radio newsgroups, how come your not over there with your phony
e-mail address trying to correct them?

One other thing there Billy Bob, your technical advise is quit a bit
less that technical correct. If you hang around theis newsgroup, and say
to yourself "I am not a old ham wind bag" there will be hope fer ya.

Jay in the Great Mojave Desert, just down the road ah ways from the
fillin station.

You're right, Michael, I should have said, not legally except
for emergencies. I actually have never used my ham transceiver
on the CB bands. I "confessed" because I knew it would drive
Dick right up the wall. I had my emergency blinkers on and was
considering using my IC-706 on CB when a kind motorist pulled
over to see if he could help. If someone had not stopped to help
me, I probably would have tried using my IC-706 on a CB frequency
since I didn't have a CB radio with me at the time and I was
out of range of any 2m repeater.

The ball mount must be well grounded as well as the tire carrier.Also
check the coax for a short with a VOM,you can do this before the radio
gets back.

3424. Re: galaxy 959

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: Don Craven <wcraven1@tampabay.rr.com>
Message-ID: <nLYw4.9849$9q2.48957@typhoon.tampabay.rr.com>
Source record: 26043

I sell and repair CBs and have over 40 years experience with CB. I don't advocate one radio over another unless it is clearly superior. Today, I put a new Galaxy 959 on the bench to see what it would do. On AM, I turned the power up to over 8 watts and the sweep was over 20 watts. On SSB, I got over 20 watts. This is comparable to a single final Galaxy or other similar 10 meter radio.

This radio is sold as a CB and is type accepted by FCC. It can easily be modified for extra channels with 2 switches. This will provide frequencies from around 26.5 to just under 28 MHZ. There are kits available that will give you 120 channels and there is a kit available to add the second transmitter final stage.

The circuit board is a variation of the RCI 6900 board. The PLL uses an 8719 IC with a different frequency reference crystal than the Grant and Cobra 148 radios. The rest of the board seems to be much the same as the 6900 board. The same modifications that can be made to the 6900 can be done to the DX-949/DX-959. The radio has a variable talkback that can be turned off.

I hope this gives you more information so you can make your own decision. I have found that the best radio is the one that does what you want it to.

>New to CB's and I bought a 40 dollar CB for my truck.
>Im a truck driver mostly driving between Hazleton PA and Long Island.

The first thing you should do is find a good tech and get that CB worked on...All CB`s straight from the box (Even a $300 one) will suck because FCC regs limit their out put....Secondly..Never call anyone a "Good-Buddy".And Thirdly (Is that even a word?)...There is so much more to CB than you think its like buying a Honda Civic and then finding out about the NHRA

I hope I did`nt brain my damage.

Wrong. It is illegal to be used by people who are not licensed for it's leg
al use.

You saying that no US amateur can own an export version Henry, Ameritron or
any of the other amateur amps?

They all have 12-10 meters, require less than the legal input for full outpu
t and would classify themselves as CB amps... Hmm.. Makes you think..

leave amateur radio to people wh0 know
> something about it so you won't sound like a lid.

You are wrong with this one, Tracey. Go back to the Llamas.

How would you build a plate modulated amp?

Plate modulation happens in the modulator, not the amp.

You could build a GG amp and a grid driven amp in the same year... And as m
any "Modulator" designs as you wished.

Pair of 4-400As modulating a pair of 4-400As kicks ass...!

Thanks for the info -- the only products I can find at radioshack.com that comes close to your suggestion of a "1/8" to 1/8" inline attenuator" is the "Add-on Volume Control for Lightweight Stereo phones" (#42-2459). If you've got the RS part number that I can look up, I'd really appreciate it.

Thanks again

I run a 102" and use the back bumper,have experimented a lot and
although I have noticed short antennas being greatly effected by a low
mount situation with the body alongside much of the antenna I don't
notice this effect with the full size antenna.

Brian:
I'm not trying to beat up on you but I have to agree with Hamm4fun and Bill.

As you say, the line is (more or less) transparent to power. Standing
waves are created by the interaction of forward power and reflected
power. The Standing Wave Ratio (SWR) is, in effect, a measurement of the
ratio of reflected power to forward power. The ratio of reflected power
is determined solely by the match (or mismatch) at the end of the line.
The discontinuity between the load impedance and the characteristic
impedance of the transmission line creates a reflection. The source
(transmitter) impedance has no effect upon that reflection ratio. Thus,
the standing waves and the SWR are independent of the source impedance.

Also, harmonics indeed can (and probably will) create higher SWR readings.
While the antenna may be a good match at the primary frequency, it is
likely to be a bad match at the harmonic frequencies. Some of the
harmonic power incident upon the antenna is reflected back to contribute
to a high SWR reading despite a good match at the primary frequency.
Power amplifiers create a greater proportion of harmonic power.

This is consistent with the original poster's observations.
The power amplifier created a higher SWR reading. This is a
very common scenario.

One more item. Because amp bias affects harmonic output, and harmonic
output affects the SWR reading, the amp bias indirectly affects the
SWR reading. You have to be careful how you interpret an SWR reading.
I believe many of us have misinterpreted SWR readings at one time or
another because we are conditioned to only consider the single frequency
model which is pretty much all you'll ever find in a textbook.

OK, maybe you're right and I said it badly...
The coax should be transparent to the system as long as the load is the same value as the charateristic impedance of the line. How's that? I shouldn't have said source...

Not only is the swr reading higher because of the harmonic
content of the Boomer, but, most all swr meters lose their sensitivity
at low power levels.
Hook that meter to your radio and take a reading. Then hook
the same meter to the same load but this time use a squeaky clean
amateur radio at 100 watts. Note the difference in the reading. There
should be no difference. But most all swr meters will show this
insensitivity difference,

If the whip is mounted with set screws in its base shorten it there instead
of cutting off the ball end. Sometimes you can pull it out of the base,
shorten it, then 'press' it back in.

3461. Swinging frequency

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: Scooter <Scooter@skipland.zzn.com>
Message-ID: <Xxhx4.397$vW1.1118@newsfeed.slurp.net>
Source record: 26080

Will setting the AM TX frequency to the exact channel frequency be OK?
A guy told me to set it high by 500 cycles because most radios are out of tune. Also will setting this frequency effect SSB TX frequency? This is on a President Lincoln. Also how can I add more swing to the radio. With the RF output turned down I key 3 and swing to 12, cranked up I key 20 and swing 50. Sideband power is between 70-80 watts, and no problems anywhere. My modulation is around 95% and it's clean as can be. I'd just like to see a lower key and just as much PEP on AM. There are no tech around and I don't want to send it out, so that is not an option. Thanks

> cey?

Kinda,sorta,but not really.I used to be primarily a CBer,I used to
sell amps and other illegal radio gear(and lots of it)I used to
freeband.I got caught at some things and although nothing ever really
came of it because I promised to mend my ways I did a lot of soul
searching and decided to clean up the rest of my radio life as well as
other areas of my life.I still get price lists on amps and stuff every
month so I know current prices.People from the group say those prices
are way too low while others e-mail and tell me not to ruin their good
thing,they threaten to get me off my guys mailing list,PLEASE DO.Many
others have e-mailed wanting to buy stuff,you guys havn't lost any
buiseness to me.I did turn some on to my guys but I doubt they can do
the volume required.
If you look back I never condemn anyone for doing anything illegal
when I answer a post,I do tell them it's illegal because a few don't
know and many think no one cares.It's when someone jumps my case for the
way I answered that I lash out,just read this thread.My original answer
just mentioned I thought something was illegal,for information.
As they say in the Llama buiseness "spit happens". 73

I disagree,CB is much more restricted,lots more rules,lots less
equipment available.Only a tiny sliver of spectrum.
Seldom do you need powerful amps to talk DX,what bands are you talking
about here? DX is my main thing and I rarely use my small SB201.I have
215 countries confirmed many while mobile.

Nope, sorry.

This device may not even be made anylonger.

It was usually sold in the parts area, and a red connector.

It would plug into the radio, and then your headphones would plug into it.

I don't have a catalog here, or I would look it up.

Which is about what the typical one does, continuously.

However, they will run the standard SSB radio, since the duty cycle is so mu
ch lower.

No, it is not new.

That is the whole point.

Once again, Prozac is riding Daves ballbag trying to tell everyone how he is inventing something new, when Messenger had them out years ago.

Just because a newbie sees something new, doesn't mean that nobody else did it before!

If what you say is true this test will tell all. check the reflect between
the transmitter and the amplifier with a 3' jumper and then try it with
a.....say 13' jumper, do this with a bird 43 and a low power element
and see what happens.

By law, CB operations within the US are limited to 4 watts carrier power (AM)
and 12 watts PEP (SSB), Hams can use up to 1500 watts on most bands. CBersare
also restricted to communications within a 250 Km (155.3 mile) radius, whereas
Ham operators are not. CB operators are unlicensed, whereas Ham operators are
required to be licensed and their operating privileges are determined
according to the license class. CB operations are restricted to 40 channels
and their sidebands ranging from 26.965MHz to 27.405 MHz. Ham operators enjoy
the use of a larger spectrum encompassing HF, VHF, UHF, and microwave
frequencies. CB operators, by law, are restricted in their modes of
communications. Hams enjoy the use of phone, CW , digital and experimental
modes of communications, utilizing even satellites, meteor traces and even
moonbounce. Anyway, those are the biggies. Hope it helps...

Ensure good ground on the mount. Double check, replace if needed,
your coax. Check all antenna connections. A 108" whip should not need any
matching at all. BTW, where are you checking your match? At the radio or at
the antenna? If it's at the radio and you're using an odd legth of coax, it
could very well give you a misleadingly high SWR reading. To get a reliable
reading of SWR at the radio end, you need one of two things. An antenna of 50
ohms input impedance (which you should have with a 108 inch whip),or a length
of coax that is an odd multiple of a half wavlength of the operating
frequency, taking into account the velocity factor of your coax. Since most
coax has a velocity factor of 66%, and a 1/4 wavelength of 27 meters is about
17 feet, the appropriate lengths of coax to use would be 1(.66x17)=11.22 feet
and 3(.66x17)=33.66 feet.
Since you have one of the two above items, you should be reading
correct SWR's. Since you seem to be reading excessively high, I would suspect
your grounding and coax. Good luck.!

Hi!

We were discussing the AH-50, 6m ham radio. Thanks for the comment though, there seem to be a lot of people who think that the Eagle is crap and cant do what the other rigs can?...

I am getting closer to getting service manuals from the manufacturers of the Cherokee AH-100, AH-50 radios... if anyone has any info on that please let me know...

Four Catholic ladies were having coffee. The first Catholic woman

tells her friends "My son is a priest. When he walks into a room,

everyone calls him 'Father'."

The second Catholic woman chirps, "My son is a bishop. Whenever

he walks into a room, the people call him 'Your Grace'."

This third Catholic crone says, "My son is a cardinal.

Whenever he walks into a room, people say 'Your Eminence'."

Since the fourth Catholic woman sips her coffee in silence, the

first three women give her this subtle "Well...?"

And she said "My son is a gorgeous, 6' 2" hard bodied stripper.

When he walks into a room,people say,

"Oh, my God...."

Sorry for the long time away fellas.....
I am still getting settled .....
Here is something to hold you over I hope......

Once uppon a time there were a horse and a chicken who were good friends.
They lived on a farmyard with lots of other animals and were very happy.

One day, while they were playing near the farm's pond, the horse setpped
into a hole of qucksand. The horse rapidly sand and was yelling for his
friend, the chicken, to save him.

The chicken thought for a minute then ran away. The chicken ran back to the
farmhouse, and jumped into the farmer's 735csi BMW. Luckily, the keys were
in the ignition, and the chicken managed to start the start the car, and put it
in
gear.

The chicken raced over to the sinkhole, where the horse had almost disappeared
by now. The smart chicken tied a rope around the back of the BMW and threw
the other end around the front legs of the horse. The chicken hopped back in
the driver's seat and stepped on the gas.

Ever so slowly, the horse eased out of the quicksand and jumpbed to safety.
The
horse, still on shaky legs, stuttered: "You just save my life. Thank you" The

chicken ust said, "Don't mention it, that's what friends are for. They
returned the
BMW and went out to dinner together in the barnyard.

A few days later, the horse got up from a good night's rest and heard some
muffled
cries for help comong from the backyard.

The horse followed the sounds and came upon a terrible scene; There was his
best
friend, the chicken, stuck in a hole of quicksand. The sand was already up to
its neck
feathers and the cries for help had almost stopped.

The horse took a quick look around; no rope in sight. And the farmer had gone
to
town with his BMW. What to do? The horse took a deep breath and spread his
body
and legs out over the hole. His cock was dangling down right above the poor
chicken
Here, my friend, grab my cock and I will pull you to safety.

With its last bit of energy, the chicken grabbed a hold of the horses cock and the horse
straightened its body, pulling the chicken from its trap. With one big step, both were
on solid ground and safe.

The chicken slumped down on the ground exhausted. Now you save my life, my friend.
The horse just smiled.

And what is the moral of this story?

If you're hung like a horse, you don't need a BMW to pick up chicks.

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN.....

You just stated the entire problem.... You have the antenna mounted to a rack that is mounted to a door that is on hinges....Poor ground at best. Run at least a 4 guage ground cable fron the mount thatthe antenna is mounted to and tie the other end very securely to the chassis under the vehicle. Clean all connections and spray anti-rust solution on the connections before and after connecting.

What you say is true but only when it is terminated in its characteristic impedance, in this case 50 ohms. One problem most people have undestanding SWR is that the meters they have DO NOT actually measure SWR. AN example off this is terminating 75 ohm line in a 50 ohm load . The SWR on the line will be 1.5:1 no matter what you do. However if the line is a 1/2 wavelength long and you measure the SWR at the end of the line away from the load the SWR will read 1:1 which is wrong. It is true that the impedance seen at this point is 50 ohms and that if the radio output impedance is 50 the match will be perfect but the SWR still remains to be 1.5:1. To this end a lot of people equate SWR with

impedance mismatch between source and load. In some cases this works out to be true in some cases it doesn't. To me SWR does not really mean that much except a relative indication of antenna/feedline health. If I know my antenna is tuned fairly well to 50 ohms and I am using 50 coax and the SWR does not read real close to 1:1 I want to know why. The fact is though that you could actually have a fairly high SWR on you line(say 5:1) and still transfer power from source to load very efficently as long as the load that the transmitter sees is the same as the output impedance of the transmitter. But none of this changes the fact that SWR is still determined only by the impedance of the line and the impedance of the load and nothing else.

Robert Walling <r-walling1@ti.com> wrote:
: He said it has a send and rec switch, so sounds like a transceiver, not a
: receiver.

Hammarlund receivers (most of them) have such a mode switch. It mutes the receiver when you want to transmit. It also activates a pair of remote relay contacts on the back of the receiver - which can be used to switch the transmitter out of standby (often by powering the oscillator). The old rigs were not well shielded - and if the transmitter oscillator ran all the time, it would often bleed into the receiver, reducing sensitivity.

Brian Griffey <bgriffey@kwom.com> wrote:
: What!
: The source and the load impedances govern the match... and therefor the
: SWR(standing waves) on the line!

Wrong, Brian. Only the load impedance and the characteristic impedance of
the transmission line govern the coupling into the antenna (which is where
the VSWR occurs). The source impedance compared to the input impedance
of the coax (not necessarily equal to the characteristic impedance) determine
the efficiency of the coupling of power from the source into the coax.

: From your statement here... I feel that you are unclear about what standing
: waves are and have contradictory statements in adjacent sentences. Standing
: waves are created due to a "mis-match" condition. The amount of standing
: waves on a line directly relates to the mis-match. In other words... like I
: said before... SWR has everything to do with impedance matching!

It appears that you are unclear - given your first statement above.

Standing waves are due to an output mismatch - any input mismatch is
immaterial.

It will appear "transparent", except for resistive losses, regardless of
whether the source is matched or not.

Look it up in a reference, Brian. There are many of them available, and
all of them agree.

I have a Cherokee and this spot and the back bumper are probably THE two worst places you could have choosen to mount the antenna. As mentioned you could have a poor ground and the body rises with the antenna so for about 2 ft you have antenna and car body side by side with just a few inches between them. My suggestion would be to ditch the long antenna and get you a decent center or top loaded antenna at least about 5ft long and mount it on the roof. You may be able to get your current antenna to match by shortening the heck out of it. I would start by removing the spring and see what effect this has on the SWR. It will probably help quite a bit. the antenna is still going to suck though. Most of the power is going to be radiated behind you.

Its fairly easy to make the sense of a circularly polarized antenna switchable.Idealy one would want to have a antenna transfer relay to do this. This is a special coaxial relay with 2 input(a&b) and 2 output(1&2). Normally a is connected to 1 and b to 2 but when the relay is energized a connects to 2 and b to 1. On 11m you could probably accomplish the same thing with a good quality DPDT relay.

: Sent via Deja.com http://www.deja.com/
: Before you buy.

One hint...you may to reset the CPU whan you rejumper the radio...if it is like the AH100..you have to put a jumper across the battery contacts overnight.
Take the battery OFF first, of course!

It's quite possible, that unless you do the above, the jumpers will be ignored..the CPU probably only looks at them upon a CPU reset.

Now we're getting somewhere. You may want to focus on the rack itself. How is it mounted? Is it grounded? Painted? Chromed? A quick fix for it would be to run a ground cable from the frame to the antenna and rack. Get hold of a volt/ohm meter and check the coax at the radio end. Unscrew the coax from the radio. Check for continuity (Connection) between the center conductor and the outer ground. If there is a connection, disconnect the coax from the antenna. If there is still a connection then one of the ends of the coax has a short. Fix or replace the coax which ever is clever.

I have been reading other replies to your post and concur. The tire rack... although connected to the car body and a viable DC ground... may be a terrible RF ground. This is probably the case since it hangs off the main mass of the car body. This introduces an inductance and by using the formula 2(PI)FL you see that the inductive reactance can be significant at high frequencies... even if the inductance is quite low. I suggest relocation of the mount to the main mass of metal on the body. Remember that after the mounting... the full length of the antenna should be in "free space"(not next to any of the grounding metal structure). This is a common mistake when mounting antennas... I see it all the time... where some guy... for convienience sake has mounted an antenna on the side of a vehicle with about 60% of the antenna right next to the body. That's a real recipe for high SWR!... and terrible performance!

Hello and thank you for looking.This is brand new,never been out of box.Carries full 1-year factory warranty. I will ship to winning bidder overnight for a flat 12.00 charge.Winning bidder to pay by postal money order.Within 5 days of auction close.Personal checks will be held till clear. We have been in business since 1986 Bid with confidence! The GARMIN GPS 12 Personal Navigator: an affordable 12 parallel channel handheld for outdoor adventurers who want a basic, hard-working 12-channel GPS, but who don't want to spend a bundle. Based on the popular GPS 12XL, the GPS 12 offers outdoor enthusiasts an entry-level way to gain the power and performance of a 12-channel receiver with fast satellite acquisition in the toughest conditions—even in heavy tree cover. The GPS 12's rugged, waterproof case features military-tough construction, and its rocker keypad design provides true one-hand operation that keeps you on the move—day or night, rain or shine. It also features 500 available waypoints and 1024 track log points, nine proximity waypoints to mark and steer clear of dangerous areas, and GARMIN's innovative TracBackTM function—a feature that turns your track log into an instant breadcrumb trail and allows you to reverse your route in order to quickly navigate back home. As an added bonus, the GPS 12 also boasts a position averaging feature which diminishes the effects of Selective Availability (SA) upon position error and displays a value that reflects the estimated accuracy of the averaged position. Include a host of advanced navigation features like enhanced moving map graphics, average and maximum speed data, and trip timers, and you have all the things that make the GPS 12 a purebred GARMIN—innovation, performance, and value.

You probably have a ground plane problem assuming all
grounding is electrically secure. The antenna is probably
"seeing" a ground plane further up the antenna. I had that
same thing on a front bumper mount on a Chev S10 PU. I put a
6" inch spacer in which brought the base of the antenna up
to the level of the hood and that fixed it.
Cheers,
John

It is only done to people who already have loose screws. Need a
screwdriver?

3545. FS: Astatic hand mics

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: GW <weatherguy@worldnet.att.net>
Message-ID: <w69x4.8397$Pq3.611550@bgtnsc05-news.ops.worldnet.att.net>
Source record: 26166

For sale a 575M6 and a D104M6B hand mics by
Astatic. Both mint condition, can wire them
for any radio.

575 - $25 shipped
D104- $30 shipped

or take both for $50 shipped.

3546. FS: SWR/power/match box combo

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: GW <weatherguy@worldnet.att.net>
Message-ID: <d99x4.8404$Pq3.611656@bgtnsc05-news.ops.worldnet.att.net>
Source record: 26167

For sale a nice condition SWR/power meter match box,
all in one unit made by Maxi lab. This is very similar
to the RMS line of products. Power meter is stepped
in 15, 150 and 1.5Kw ranges. Works very well. Match
box can be turned on and off with pass through.

$50 shipped.

This is true, however Harleys are a so-so example because even
when they were a pile of crap--when the company was bought by
AMF--people bought them and would buy nothing else. Not primarily
from pride--although that was certainly there, but LOYALTY! Loyalty
is earned the hard way--at least true loyalty is.

Either that or....

1. Make sure you have a tight ground

2. Purchase a filter for the phone (RFI type) maybe at your local Rat Shack

3. Replace your audio limiter and un-tweak it, so its not such a splatter box

4. Keep your radio done up doing that swing thang and live with it... <g>

Rob wrote in message <8a2ktslpf1@news1.mpx.com.au>...

3559. WTB: your old handheld batt-op LED calculator!

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: floetay@aol.com
Message-ID: <20000307122047.02106.00000553@ng-fz1.aol.com>
Source record: 26180

Here's what I'm looking for: handheld-type battery-operated calculators, mostly the LED-type calcs from the 1970s, the ones with the reddish, blackish screens, often with glowing red numbers, as opposed to those you see most often today, with their typically grayish LCD screens (except for HPs -- love em w/ any screen!). I'm looking for all makes, all models, as long as they work and are cosmetically clean -- see partial list below. (The only calcs I don't care for are those made by Texas Instruments.) Anyway, if you've got the old manuals, cases, chargers, so much the better. Just drop me an email (floetay@aol.com) and let me know what you have and the condition it's in, and we can go from there. Thanks!

Calcs I'm interested in include, but are not limitted to those made by: Hewlett Packard (all models, both LED and LCD), Adler, American, APF, Apollo, Aries, Aristo, Berkey, Brother, Busicom, Caltronic, Candle, Citizen, Colex, Columbia, Corvus, Craig, Crown, Dataking, Decimo, Dictaphone, Digicomp, Dixon, Edmund, Enterprex, Facit, General, GIC, Hanimex, Hermes, Iain Jones, Ibico, JC Penneys, Kingspoint, Litton, Logitech, MBO, MITS, Master, Melcor, Mintron, Monroe, Omron, Ordibel, Panasonic, Pico, Pye, Ragen, RBM, Regan, RFT, Ricoh, Royal, Samsung, Sanyo, Sears, Sinclair, Spectrum, Sperry, Summit, TKS, Toshiba, Universal Data, Verax, Victor.
Good golly -- can you believe there were once about 220 brand-names in all?

3565. Any Opinions on the Cobra 75 WX ST?

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: Big Daddy Chico <bigdaddychico@yahoo.com>
Message-ID: <Lcbx4.1988$HN.104429@bgtnsc06-news.ops.worldnet.att.net>
Source record: 26186

I am interested in any general thoughts/comments on the Cobra 75 WX ST.
Also, are there any tricks to splicing the power wire from the receptor box
and replacing it with a cigarette lighter adapter? I'm guessing I can just
replace the red wire at the fuse connection and use electrical tape and a
wire nut to connect the black wires.

Thanks!

3566. Help with headphones for Grant XL

Newsgroup: rec.radio.cb
Date: 2000-03-07 00:00:00 UTC
From: The Fu-Man <thefuman@yahoo.com>
Message-ID: <mtbx4.2015$HN.103936@bgtnsc06-news.ops.worldnet.att.net>

I'm trying to use Walkman type headphones in the external speaker jack of my Uniden Grant XL. I can hear everything, but there is a constant "hiss" that is present even when the volume is turned down. Is there an adapter I can use to get rid of the hissing noise or are there particular headphones that I should consider?

Thanks for your help

You are hearing the "hysterisis" of the internal audio amp.

Go to radio shack and get the 1/8" to 1/8" inline attenuator.

You will have to turn the volume up higher than normal, but it will kill the static.

>>>No, it wouldn't. Any licensed amateur operator can and some do, use CB t
ype amplifiers. Messenger and Texas Star being the most popular.

>thats why you don't see them for sale at HRO or AES like the legal amps.

You don't see them for sale at HRO or AES because to do so they would have t
o put an attenuator and 12-10 meter filter on the input of the amp to meet F
CC type acceptance laws.

Yet another case of an Extra class who knows nothing. Go play with your Lla
mas.

3578. Are Phillipines made Cobras really better?

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: pontiac787@aol.com
Message-ID: <20000307191145.15542.00001772@ng-de1.aol.com>
Source record: 26097

I keep reading all this hype on how Cobra radios such as the 148 GTL made in the Phillipines are so much better than those made else where. Does anyone know if there is any truth behind this rumor?

3579. What is the difference in Amps?

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: pontiac787@aol.com
Message-ID: <20000307191745.15542.00001783@ng-de1.aol.com>
Source record: 26098

I am looking to buy a amplifier that puts out 100-250 watts to use on AM and SSB. I've found a Trainbuilt 120 watt and a Palomer 250 for about $130. Is there really a difference? I'm leaning towards the Train Built because even though it has less power it seem like a better quality amp. Any help would be appriciated.

Thanks

Make sure that you have a good chassis ground from the spare tire rack to the vehicle body. Realize also that in that position, you will have higher than normal SWR simply from the vehicle chassis reflection back into the antenna. Although I don't think you should have 3:1 or higher just because of the chassis body reflection. Your best results would be to mount the antenna on the roof of the Jeep (I have two Jeeps, much experience here).

You need to be sure that the transistors are not biased Class "C" if you plan to use the amp on SSB. Find out before purchasing either amp.

The person who told you to offset your frequency by 500Hz is full of @#%. First, if most CB radios are off frequency, which way are they off, above or below the base frequency? Most CB radio front ends are designed poorly enough that you will probably be able to detect someone that is off by 200-300Hz anyway. I can't help you with the swing on that radio but I don't know what you are complaining about from what you say. That is a good radio as is? But, how did you determine % of modulation? I hope not with a meter.

John

Yaesu XF-32A SSB filter for FT101 series, $40.00

Tram D201 Parts, Wood End Caps, Meters, Crystal/selecter Board, Transformers,
Face Plate, Knobs, crystal filter, Etc... Inquire with your needs,.

Misc. 24V Switching power Supplies, Cosel, Power One Etc... Most new in the box

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00 Obo

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced!

Commercial VHF Handhelds:
Motorola Radius P50 (Weak Battery)
reasonable offer SOLD

Kenwood TK240 Commercial VHF Handheld with drop in charger, great battery,
great condition.
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $130.00 Reduced to $100.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00 SOLD

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Icom IC-230 with manual, mic and mobile bracket. not working correctly, VCO
unlocks but in great cosmetic condition,, $30.00 Shipped

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and
D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required, super clean! $150.00

Yamaha FG-460S-12S, 12 String Guitar, Beautiful guitar, near flawless, Gold
hardware, Pearl inlay, Seymore Duncan Acoustic Pick-up, Hard Case $350.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics
Meter, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, clean!, Surplus, As Is
$40.00

Alan K1313 10 meter Single Tube Modulator, 110 VAC, With Spare 6KG6 tube, New
Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs
right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a
Demco Tube Modulator. Smooth Clear Audio! $200.00 Obo

Pentax K1000 35mm Camera, Wide and normal lens, 2x teleconverter. Cokin filter holder with flare guard. Several special effect Cokin Filters, polorizers and acessories, carrying case etc... $250.00 Obo

SBE Trinidad , 23 channel base CB, near perfect condition, original manual $70.00

Fluke 8050A Digital Desktop Multimeter, AC/Batt, needs new batt. but works great on AC $50.00

NF Circuit Design Block Model CR-116 Low Distortion Signal Generator, $125.00 Obo

Misc, Yaesu FT101 Components and parts, Misc untested boards, Email If you need something.

Electrovoice Mic.... See Website!

Misc 19" Racks..... Email for Details

Will Trade For Mustang 5.0 Parts Or Kenwood TS520

Hello!

Yeah- when I did the AH-100 mod, I tried to get it to work right away
and it didn't. I was dissapointed but I left a alligator clip jumper on
the terminals overnight and the next day it worked...

In the manual for the AH50 they actually state that a microprocessor
reset (in case of a lock-up) can be achieved my momentarily shorting
the batt terminals ('with a coin' they say:)

I tried this after doing the 'mods' and still nothing happened...

Still looking for AH50 mod info if anyone has it :(

: Agreed Bill... the resistive losses go without saying in my book.
: I was talking strictly about standing wave losses.

The SWR losses do not depend on the source match either. If they did,
then convenient tables showing the additional power loss due to SWR would
not be in the simple form they are. They would have to have an axis for
the input mismatch.

Actually there are no losses directly attributed to standing waves.The presence of standing waves does increase other losses, such as dielectric and resistive losses.

3597. Siltronix 1011s for sale or swap

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8a4qa9$6r2$1@slb6.atl.mindspring.net>
Source record: 26216

For Sale or Trade -

Siltronix 1011C with manual reprint. Works, but low output and drifts

Siltronix 1011D with manual reprint. Will not load up correctly. Receiver aligned and TX aligned per service info in manual. I think the 8950 is unstable, and don't want to pay the price for a new one to find out.

Siltronix FD-1011A frequency display for the 1011D. Works, with manual reprint.

Prices:

1011C, Manual, Power Cord & Hand Mic - $150.00. Will trade for Midland 79-290 in good operating condition with Mic, bracket, manual and power cord.

1011D, Manual,Power Cord, & FD1011A Display - $250.00. Will trade for RCI 2970 in good operating condition with Mic., bracket, manual and power cord

Open to other trades on rigs with SSB, export rigs or vintage CB / Ham rigs. These units show oxidation and discoloration on the chassis, also have paint chips on outer cabinets. They are not pristine, but could be put back into operation.

Please reply via e-mail to dalite01@sprynet.com

Source record: 26231

The 75WXST is a nice small compact radio. It is limited in the receive in that when the squelch is turned so the noise is gone a conversation may come in choppy until you back it down. If an emergency radio is what you are looking for, size is important and you aren't a hobby talker, this radio is the one for you.

Get a good antenna and your set.

Just wire a cig lighter plug to the end of the wires and you can plug it into a the cig lighter receptacle. I think that is what you are asking. Do it all the time.

No tweaks available for this radio as far as I know.

Source record: 26232

What is it you need to know. Some things won't be found in the owners manual.

E-tone is your echo reverb. If you want to use the voice changer an Robot you flip the switch. The voice changer will change tones when you adjust the e tone ring. You must re adjust the echo after playing with these toys. The robot talk is only one tone.

The band switch on hi. Selector switch on A. That will get you to E band. A,B,C, D are low band E, F, G, H are hi band.

10 k switch will put you one channel off. Good for those like 27-195 that can't be gotten through conventional methods.

The rest is easy. The RF PWR ring is to adjust the Dead Key.

Let me know if I can help you any more. You may get to Galaxy's Web site and ask them if they will sell you a manual. They are usually pretty helpful.

I completely forgot about Raytheon radios. I used to love the classic look of the Raytheon radio line because the radios were so beefy. What was the model of the 5 channel CB? It had a transformer in it that could power 10 radios.

Yes, a lot of SSTV on 27.700, but mostly foreign, so the signals are weak. American CB'ers seem happy with just a mike in their hands, but overseas, many people are using their computers with their CB radios to create wireless networks and also for picture sending, like on the ham bands. Maybe the FCC will legalize digital communications on CB. It's already legal in some European countries.

Well, that is a good place to start. What is the current going price on Siltronix 1011's. It has been years since I plunked down the $500.00 for a radio without a Mic. I realize that prices go down on older items, even if they are no longer available for purchase, and still viable for use.

Message-ID: <8a5n9u$jo2$1@slb0.atl.mindspring.net>
Source record: 26245

Look in rec.radio.swap. There was a FT-726 R listed for around 500.00 that is a good rig for sats. You need to be sure that it has a satellite duplex board if you get a 726; the FT-736 comes with this stock, and brings 800.00 to 1200.00 used. You must be able to have inverting VFO';s; ones that will go up the band on one band and down the band on the other to match the transponders on the SSB birds. The FM LEOs can be worked with any dualband FM mobile. I would go with the 726 or 736 over the Kenwood 790 or split rigs, as it will take 3 hands to run the works, even with rigs such as the Yaesu that offer inverted and synched VFO''s. Also look for a Kansas City Tracker/Tuner (designed by Brooks Van Pelt). It will run the antennas and tune for Doppler shift during a pass. You may want to look at www.amsat.org for a source of sat tricks and tips. It is a great part of the hobby, and can provide dependable roundtable's lasting up to 10 hours with other hams on the half of the world "lit up" by the pass. Count on needing 100 watts on 70 cm and good rx preamp (gaasfet) for 2m. Mirage has the best preamps, RF Concepts comes in second. Mast mounted are better, but will require a bit more maintenance. The Kenpro or Yaesu AZ/EL rotors are almost a must to turn the array. The Kansas City Tuner comes with info for interfacing to some of the common Alliance/Genie rotor boxes in use today, if you like to home-brew. Count on an original ante of over a grand to get the cards on the table.

Good Luck with the project..

3630. Ranger RCI-2950 replacement parts

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: "Jacek M. Holeczek" <holeczek@us.edu.pl>
Message-ID: <Pine.GSO.3.96.1000308153641.580C-100000@uranos.cto.us.edu.pl>
Source record: 26249

Hi,
I think I need to buy some replacement parts, but I cannot find any place where. Could someone, please, direct me to the correct place ? I tried to write to rci@rangerusa.com, but I've got no reply.
I am thinking about the whole CPU board (so that I don't have to resolder the IC601), but if it costs much more then the IC601 itself, I will buy only the chip itself.
A brief description of my problem follows.
I've got my hands on a used Ranger
RCI-2950. There are three problems with it :
1. sometimes when I press a button like "SHF" (or "LOCK"), instead of the required function to be performed a frequency change happens like I had pushed the up-down arrow. Is there a known fix for it ?
(I saw a "fix" to lower the R611 from 47k to 10k, but in my ranger it is already 6.8k, then another fix to increase the C621 - directly connected to R611 and the CPU-pin-16 - to 100nF, which I did, I increased it to some 500nF, but it doesn't help)
2. the frequency knob above the mic plug does not work AT ALL (both the up-down arrows and the buttons on the mic DO work)
3. The battery was dead, so I replaced the internal 3V battery, but I noticed something drains it. After two/three days off it was again dead.
I took some tests and ...
The whole CPU related logic is divided across two boards. One with the CPU itself (marked as IC601) and the battery, the other one with another big chip (marked as IC701) and the LCD display. If I remove the "display"-board, the battery immediately behaves fine. The problem that something drains the battery is then related to IC701 - and this in turn is related to pin 2 of this chip which gets the battery voltage all the time.
I think now that the IC601 is slightly broken.
As I have already written the problem lies in pin 2 of the IC701, which is called "READY", which gets almost the whole voltage that the battery is giving. I guess this input is "protected" against input voltages higher then the VCC via some kind of an internal diode, and this (internal to IC701) diode "delivers" the incoming voltage to VCC (which should be 0V when the receiver is off), and that means to all other parts, for example to R611/C621/CPU-pin-16 where the voltage is about 1.4V (I don't remember now) - this drains the battery then. IC701's pin 2 gets the voltage from the IC601 pin 48 ("D0"). I guess there should be NO voltage at all

when the radio is off. To be sure I would need to get my hands on a working RCI2950 and measure voltages when it's off.
Additionally, if you look at the schematics you can find that the frequency knob, which is not functioning at all, is connected to pins 50 ("D2") and 51 ("D3") of IC601. They also have voltages (slightly less then the one on the pin 48) measured when the radio is off (btw. these two lines should be inputs ?, but when the radio is on they have almost the same voltages as the VCC). I guess then that the IC601 has some lines broken in range D0-D3.
Again, to be sure I would need to get my hands on a working RCI2950 and measure voltages on these lines when it's off (and on :-). I would be very happy if someone from you could measure these voltages for me ...
Thanks in advance,
Jacek.

3635. CB on an island without electricity

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: rcpmd1@aol.com
Message-ID: <20000308112540.02589.00000673@ng-fk1.aol.com>
Source record: 26254

We need a CB setup to operate on an island 3-4 miles off shore where there is no electricity. What would be the best CB radio to use to reach shore and, then some, and what would be the simplest source of continuous electricity? How long would a 12 volt car battery last before needing to be recharged if the radio were left on most of the time but transmissions were infrequent? What size solar generator would be necessary to keep the battery charged? Does anyone know specific brands, costs, etc.? The radio would be used mostly for routine contacts to our station on the mainland about 5 miles away but also I would like to have as strong a signal as possible for emergencies. Should SSB be a onsideration and would the Coast Guard, for instance, be able to receive a SSB signal? Thanks for any help or suggestions.
Bob Patten

I just purchased a Turbo yesterday. it was a problem that i didn`t know about. the problem is the channel knob, when turning the knob the frequency sometimes jumps from 10khz to 50 khz. the up down buttons on the front of the radio work just fine 10 khz at a time. Can anybody help me will this problem ??
thanks much, Garry

Message-ID: <12714-38C686DC-14@storefull-116.iap.bryant.webtv.net>
Source record: 26259

It appears that the number of postings are going down on this group. Web tv has a limit of 1500 postings that any NG can contain and this group is showing slightly over 900 today.What goes with the older postings? Why not leave them so the count will remain at 1500 all the time. No need to reduce the content until the space is needed. Just something that bugs me. Have a good day.

3644. Re: CB on an island without electricity

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <0Awx4.317$qa.8851@newsread1.prod.itd.earthlink.net>
Source record: 26263

Well, keep in mind that most of the CB sets you'll find are pretty
power hungry due to the uControllers and the PLL design. And
while SSB is more efficient, running most SSB rigs will cost you
in power at the power jack, where it matters in your case.

Your best bet is probably to get a CB HT. They are generally
designed for much better power consumption figures. And a lot
of them have a hi/lo power switch, letting you save even more
power when it's not actually needed. Just make sure you get
one with an external jack for antenna, power, mic, and speaker.
Not all have all the jacks.

As to your installation, get a decent antenna, and get it decently
high. Then 99% or more of you communications can be low
power. 5 miles? Just getting a decent antenna 20 feet up
should be more than adequate. I'd go for the most 'durable'
antenna you can find. In fact, I might want to build my own,
rather than rely on a normal 'consumer' CB antenna. Something
built to take a gale, if that's the kind of emergency you're
implying.

Get DEEP CYCLE marine batteries. You'll pay a premium here,
but they do NOT deteriorate like a car battery does from discharge
cycles.

AND I would seriously recommend you augument the site with
solar power. Figure if your HT draws 100ma in receive, and your
transmit time is light or low duty cycle, a panel that can provide
you with 500ma or more of charge current should be more
than sufficient to cover you for a few days of overcast without
any worries of a battery going dead. And I would recommend
TWO batteries. Alternate them and keep them 'topped off'.
That way if one DOES go down, you can 'switch over' and be
assured of a 'full new battery' to use. With light to moderate
use, and a battery the 'size' of a car (you'd have to check power
consumption figures and AH ratings) I wouldn't be surprised
if you could get a week or more out of a 'topped off' battery.

Remember, the more reserve you put into your solar panel,
the faster you can recharge. But also remember that when
the weather goes to crap is also the time you CAN'T recharge
from solar (well, ok, it MAY help a little, but certainly not much
on overcast or stormy days).

Finally, I would recommend that EARLY ON in your setup you
TEST the system. I know, sounds obvious. I mean test to failure.

Not destructive, but FIND OUT how long a battery last in normal
usage. Then remember, non-normal usage is probably the same
kind of time when you won't be able to charge the battery or get
a replacement in easily. And FIND OUT how low the CB set
will operate in terms of battery voltage.

Mike

Make sure you turn the radio off before turning off your power supply.
Leaving the radio "on" with no power will drain the battery.

if you have a 3:1 swr then look for an open or a
short.....probally at one of the connectors or at the base of
the ball mount.....if its that high it should be easy to find...
and yes , tire racks don't make good grounds. but they ain't
that bad....

Well, your test is less than perfect and this is why I say you
must be careful in how you interpret SWR readings. Too many folks
(I've seen it over and over on this newsgroup) misinterpret some
data and use them as a justification to ignore RF theory despite
the fact that the theory is based on countless observations spanning
over many decades.

With ideal, lossless 50 ohm jumpers of any length and no common mode
currents, there will be no difference in the readings.
However, under realistic conditions where there are losses and
the characteristic impedance may not be exactly as advertised
and you may have some amount of common mode currents. Because of
this, there may be differences in the SWR reading.

I'm still curious about the results of such a test. Why don't you
go ahead and perform the test and give us your results? I would
trust your data. Just don't assume that two SWR measurements tell all.

Coincidentally, I had an '85 Jeep Cherokee Chief with a whip mounted with a
spring and ball to the spare tire rack. It had a great match. Something
is fundamentally wrong if you have a 3:1 match. Look for a short or an open
conection.

I know there is more than one tire rack available for the Jeep Cherokee.
Mine was like a big rectangle with a big pin that stuck into the bumper.
It had a couple cross-tubes. I welded a small plate (about 4" square)

near the top on the cross-tube/top tube/right tube. I then drilled holes for the ball mount.

I did nothing special to achieve the great match. I just connected the coax shield to the nut that held the ball mount and I connected the coax center conductor to the antenna.

By the way, I also mounted a power amp inside the rear quarter panel completely out of sight. I bought a genuine Jeep foglamp switch and installed it in the dash after popping off the cover on an unused switch location. I used this switch to remotely switch a power relay to turn the amp on and off. It looked completely official.

Furthermore, I mounted a slide mount on the ceiling just above the center rear-view mirror. There is a hollow tube-like (but flatter) structure around the windshield. I drilled holes in it and used self tapping screws to attach the mount.

It was a slick setup. That was a good vehicle. It was still running fine when I sold it with 285,000 miles on it.

3661. cobra 148 GTL or Cobra 29LTD

cobra 148 GTL or Cobra 29LTD that is the question? I have the Cobra made in Thailand, the one made in phillipeans is the better of the two right? How about for just raw am audio?After modification the 29 out performs the 148 if Im correct.

I was thinking about doing the 12V mod two the final, does anyone have info on how to do that? Does it work? how many watts am I looking at? or is it better to just throw a am 30 modulator in line instead?

You should never run power on a base. It WILL mess up your neighbors.
You will need about 10-15 amps per 100 watts.

69 feet????? I think you have made a fruedien slip... Thinking about your girlfriend?
I'm afraid the number 69 doesn't have much meaning here. Generally, the higher the better. With this type of antenna it's good to have a minimum height of about 1/2 wavelengh(18') to ensure front lobe quality.

Not only do deep cycle batteries hold up better from repeated
discharge/charge cycles, they also have a different discharge curve,
holding more of their max amperage for a longer period of time and falling
off quickly rather than rapidly losing a full charge and running longer at
reduced power.

You don't need a transformer.

You get a transformation in the L networks that he is using.

However, your odd order harmonics are THROUGH THE ROOF with this design...

I would venture to guess the only reason this is being done is to get back a
t Danny and the X Force boyees... It would give Dave bragging rights on get
ting more power out (better efficiency at the expense of bandwith), and not
have Danny and crowd copying his shit again.

However, Griffey is right.. You REALLY need to test this shit going into ev
ery day loads, not just that monster Altronics!

TollHolio

Messenger AM-30
Messenger M-80

SCP amps of old.

Mosquito L-30
Dragon L-30.

Some of the biggest pieces of shit are the "no transformer" type amplifiers!

If you want designs, pick up the CB Tricks Volume II... It is ubundant with
them.

As is the Motorola App Notes on MosFETs.

3686. Handheld problems

Newsgroup: rec.radio.cb
Date: 2000-03-08 00:00:00 UTC
From: John Axsom <johnnya@netins.net>
Message-ID: <8a6r7pssu1@ins20.netins.net>
Source record: 26355

Hi, i'm new here, so i'll try to make this as short as possible. I have a handheld "Midland" 40-channel CB. It's a second hand one (but is same as new), but the volume is messed up. Sometimes you can't hardly hear it, but if you squeeze in certain places, it makes the volume return to normal. I'v had it apart, and I can't figure out the problem. Does anyone have any ideas or suggestions? I really hate to go buy a new one, when I have a perfectly good one here.

Well, thanx in advance.
John.

Handle: Silverbullet

ARMADILLO SUCK.BUILT LIKE SHIT, TELEPHONE WIRE FOR ANTENNA CABLE. USED PILLS ETC. AND NOT SERVICE WHEN CALLED. I KNOW FROM EXPERIENCE. ORDERED A TWELVE PILL THAT TOOK ME SIX MONTHS TO GET, WHEN I GOT IT IT WAS SENT FROM GEORGIA, BLACK IN COLOR, TELEPHONE WIRE AS COAXAL CABLE, BURNED PILLS AND A REAL PIECE OF SHIT. WARNING DON'T BUY THE ARMADILLO AMPS!!!!!!!!!!!! REAL SHIT!!!!!

I do not in any way assume that two readings tell all, I just have seen this numerous times in the past. I due know that when dealing with theory that is exactly what we are doing is dealing with theory. If you try this test on say a palomar 300A you will notice that when you change the jumpers your output will change slightly as well, not much but it will. But if you retune a little it will go right back to where it was with the shorter jumper. If you do this with your voice it will be hard to get a true reading, but if you inject a tone it is noticeable.

I agree the tuned circuit "can" work well if tweaked, but I don't know about
mass production or larger amplifiers with this design.

This is not new, and a hell of a lot cheaper than using ferrite, in the photo you can see the dust build up and if you look real close there is cobwebs coming off of one of the trimmers.

I need a working Frequency Counter and the complete Channel Selector
with the LED's and wires from the main board for a Cobra 2000 GTL.
Must be in good shape..... I have several parts for other radios as
well and can negotiate a trade if desired.

E-Mail me with what you have and what you want.

You should restate that to: "and yet Some Of the people of this news
group are constantly pushing them on anybody
that will listen".

Since I dont push them on anyone. I hate RCI's and would never push a
worthless radio on anyone.

don't think you need to worry about which one is better you have two really good radio's as far as the mod for
the power out you shouldn't need it. If you take the TR18 out of the 29 you will have all the radio that you need you will have more modulation then you will know what to do with. Know it time to ask a question from the group, I have this president grant that I have no audio at all the rf gain is wide open but still no audio I have good receive and good transmit It has just doesn't have any audio I have know idea what is wrong with it.

I also am looking for schematics for this radio if anybody have some I sure would like to buy them from you please e-mail me at lilmule@up.net thanks Mike

I've checked all the plugs and they appear to be plugged in properly. I've not disassembled the front of the unit to physically see the switch but when I turn the switch on and off I get a slight fluctuation in current on my power supply. The radio is drawing 0 amps when turned on. I think I'm seeing a capacitor charging. Is the plug you are talking about have a red and orange wire located toward the back left side of the radio?

Jim

You problem have a short on spot where it mounts to the vehicle they can not touch the ground and the lead to the vehicle or you will have a 3.0 swr or higher that means that you have a short some where.

3719. Help, speaker squealing

Newsgroup: rec.radio.cb
Date: 2000-03-09 00:00:00 UTC
From: Hutch <hutchgNOhuSPAM@earthlink.net.invalid>
Message-ID: <05d831f0.fa6efbf5@usw-ex0102-015.remarq.com>
Source record: 26315

I have my 2-meter and my CB hooked up to an external speaker in the truck. I used a Y-adapter with 2 1/8" plugs, one into each radio. Then I have the external speaker plugged into the Y-adapter. This way, I can unplug the external speaker easily and plug an earpiece in (with a quick disconnect at the Y) without getting on my knees to reach behind the radio. Then I can listen while my wife sleeps or reads on long road trips. The problem is, when I key up the CB I get a loud squeal from the speaker. This only happens on the CB, not the 2-meter. If I move the speaker way away from the radio, It's ok, but that's not practical. Any ideas to cure this?

OR

Is there a way to plug in an external speaker WITHOUT it disconnecting the internal speaker automatically?

Any help would be appreciated greatly.

Thanks

Hutch

My radio has a hum while in transmit mode. If i touch the back of the radio while i am transmitting the hum goes away. How can i get rid of this hum?? The microphone is wired correctly, and has really good audio otherwise. What kind of grounding solution can i resort to...since the hum does go away when i touch the back of the radio i am assuming that this is ground problem of some sort. I tried an electrolitic capacitor on the output terminals of my power supply....nothing. Any ideas??
Thanks

Source record: 26318

Desolder the microphone wires and connect them to the wires of a 2 way switch, then solder the wires from a modular phone jack to the switch as well. Mount the switch and the jack in the phone...when you get it wired right, you flick the switch one way for voice, the other way to cut out the mic and receive signals from the computer. Then watch the scanner newsgroups for threads about computer signals on 49 mhz!!

Well first you have to remember that some people build to make a living.
Dave's amps are the most common amp out there, of course he will win the
keydowns, now don't get me wrong, his amps are a well built piece of
equipment. I know that down here they do not win that much, In the south the
guys that win a lot are not worried about whether or not 10 will do the same
as each other, but more worried that one will do more than any of

I agree, I figured that it was you, I will agree with this. It is a hell of a design when perfected, and it will run, and run good and clean when tweaked. It is just more temperamental than ferrite transformers.

>that you will probably be able to detect someone that is off by 200-300Hz
>anyway. I can't help you with the swing on that radio but I don't know what
you
>are complaining about from what you say. That is a good radio as is? But,
how
>did you determine % of modulation? I hope not with a meter.
>

How do YOU determine % of modulation? I use a high quality meter with
SWR/Power (10/100/1000 watts)/Modulation and it seems pretty accurate...

I searched the internet looking for this mod. I found
it in a few places. After I did followed the directions
best as they were written....I got nothing. Anyone
really have 120 Channels with their Midland 75-820,
or is this a bunch of shit?

Bob.

I seem to recall there was a mod to help with this on the 2510.
I'm betting that there is a similar mod for the 2950.
The mod had to do with changing the current/voltage thru the ch
selector. This was supposed to stop the runaway freq steps.

3729. Fed and /or comercial frequency alocations

> Thanks
>
>
>

Make sure your entire system is properly grounded.

What are you using for a power supply? Make sure your PS is fully regulated, if it is, a diode may be going out in its rectifier circuit.

Have you tried running it off of a car battery? If so, does it still hum?

Also, check your PS to make sure it is fully up to the job of powering your radio. Running a PS at full peak capacity can also cause a hum due to pending failure of the regulation circuits. For most standard radios a 5 amp supply should be fine, 7 would be better, 10 is plenty. But it all depends on how many watts you are txmitting and the efficiency of the radio.

Your mileage may vary....

Grif

3734. I Need Help to connect a Cordless Phone to a phone jack..

Newsgroup: rec.radio.cb
Date: 2000-03-09 00:00:00 UTC
From: jimmyloco@my-deja.com
Message-ID: <8a6ti0$gp8$1@nnrp1.deja.com>
Source record: 26374

What I want to do for "logistical" reasons is to jack into the cordless part or handset, to use the cordless handset as a wireless modem. No Cordless phone on the market today has a "jack" input/extension "output". Sure many cordless phones have "headset" jacks , but how can I convert these signals coming from the headset jack back into a twisted pair telephone line?????????

I'm at a dead end and I need help, some guru out there , please help

Sent via Deja.com http://www.deja.com/
Before you buy.

3735. Which Linear is best?

Newsgroup: rec.radio.cb
Date: 2000-03-09 00:00:00 UTC
From: pontiac787@aol.com
Message-ID: <20000308195103.15519.00002322@ng-de1.aol.com>
Source record: 26375

I am looking for a linear that puts out between 120-250 watts. I want to spend about $130. I've been considering a Trainbuilt or an X-Force If anybody has any recomendations they would be appriciated.

Thanks,
Ed

==========
i agree on him having something they cant copy, and it has proven very
efficient, in a keydown situation bandwith is of little consequences, he
does things as a personal challange he doesnt need to get back at them to
him they are just pimples on his arse!

i am quite sure he also has a grasp of how and where it needs to be tested,
he saves the altronic for the ac boxes and uses a bird load for the dc
equipment ... then of course theres the antenna system...

How do you externally combine with out modifying the keying circuits? I have heard of this being done before but was told its not the greatest way of combining.

You could have a cold solder joint somewhere on the board or try to
make sure none of the wires or cables are getting pinched. Also check
to see if the wires From the Volume control to the board are secure.

Dave is the best in the WORLD , i don't want to sound like a dave
ass kisser, but facts are facts he builds a fine product and the
consistency is the greatest factor when you consider his boxes win .
i mean the guy that wins the big break has the same box that you can
buy . i hear these people say my box is comp ready ......well all
daves boxes are comp ready my 16 pill is made just like big dogs 16
pill box . i used to buy 10 5 pills at a time and each one did the
same on the meter when i tested them. tell me who else does this
and dont say x force or the outher copy cats ....BusDriver

It would be a pox battery if it only lasted for an hour of constant use. A good sized battery will last for a much longer period of time, particularly if it is used more on receive than transmit. The inclusion of a decent sized solar panel will be a help. Depending on weather conditions and of course your budget you would be better of using a wind generator, and another thing to consider is a different radio. CB is useful but I would not rely upon it as an emergency radio as there are often conditions that mean it is next to useless. Depending on your organisatioon you would probably be better of with a VHF marine radio - and this I can guarantee the coastguard will be able to communicate with you using this type of radio.

Lower 1/2 of driven element is the same as the "loop" section of A-plane, found a new leftover one several years ago in an old shop, had really good results with it,of course it is a vertical only yagi, didn't like the hardware much (lots of plastic end and center brackets that broke easily right at the stress points of joining elements to the boom), and ice storm dropped it in a big hurry while my 5 element 10M mono mounted horizontally survived well.

#1,I see what the problem is I don't know if you are the Busdriver around Spartanburg,SC .#2 you are comparing a DaveMade mobile box to a base box.#3 you can't trust all meters.#4 I didn't curse you,so you don't need to curse me.Let's keep it clean.#5 I don't know what it is with DaveMade amps,yall need to stop lifting this man up like he is GOD.#6 There's a whole lot of better technicians in the US that can take a 3pill and get 600 watts out of it.I know a guy in Georgia whose 3pill base box and mobiles can do 550-600 watts easy on one watt drive.There's one other person in Fayetteville NC named BODine that 3pill mobile or base can do 600 watts.You only told me one person,if this the Busdriver from Spartanburg county you will be hearing from me again.Thank you whoever you are.I have your 800 number.

3765. Help - CB Antenna Install

Newsgroup: rec.radio.cb
Date: 2000-03-09 00:00:00 UTC
From: keninma@aol.com
Message-ID: <20000309080854.02116.00000798@ng-fz1.aol.com>
Source record: 26405

Well, I'm getting ready for the new Jeeping season and I find that my previously OK CB install is causing a loud squeal (on receiving CBs) whenever I transmit. OK, so I get out the SWR meter and it shows a short (reading in the red all channels). I am using a radio shack CB, with a 4' Firestik antenna mounted to the tailgate of my Jeep. I have grounded the mount to the inside of the tub where the third brake light grounds. I'm using 18' of R58/U coax and a K4A firestik stud with a modified Radio Shack mount.

To try and fix this problem I have replaced both connectors on the cable. Now the radio sounds really good, and so does my transmit. BUT the SWR meter still shows a short! I have checked for continuity and find that there is a short (continuity) between top of the mount stud (insulated from the mount itself) and the mount. If I disconnect the cable, the short goes away. The cable does not show a short. The connector pins and ground do not show continuity so they seem fine. But when I connect the cable to the radio and the mount, the short reappears between the top of the mount stud (hot) and the mount (ground). Any ideas? My guess is the cable is bad, but if so, why don't I see a short when I test the connectors at each end?

Thanks in advance,

Ken

You will sometimes get STRANGE readings for continuity when dealing with radio equipment simply because the continuity tester is using a small DC voltage which will see little or no resistance on an inductive circuit where RF would find significant impedance.

You've mentioned testing the system with the antenna off, but the cable assembled to the mount and radio. And you've mentioned testing the mount by itself and the cable by itself (at least connector to connector). BUT you don't mention testing the system with the antenna off, the cable connected at the mount, and the cable not connected at the radio end. I'll bet you don't find any continuity, then when you hook it to the radio you will. The circuit inside the radio could (and probably should) show continuity across the antenna connector because it probably uses a transformer to feed the antenna. The coil winding of a transformer shows continuity because it is nearly a dead short at DC.

It's fairly hard to screw up a Firestick, and with the fix you already made you note that the radio works properly, but you say the SWR meter shows "a short" -- that's another matter because an SWR meter doesn't show shorts. If you mean that it shows a very high SWR, that would indicate a problem, but it doesn't necessarily indicate where or what the problem is. In the case of that antenna, with the rest of the system as described, I'd be very surprised at the kind of max reading on an SWR meter that someone might describe as "a short." So, the next thing to check is THE SWR METER. Use it to test another system. Do that check yourself to make sure it is being done the same way you are testing the system on your Jeep.

From: Michael Wittenburg <mdw@icon.co.za>
Message-ID: <38c7c232$0$35289@helios.is.co.za>
Source record: 26414

Hi,

am looking at installing a GM900 in my Jeep Wrangler (TJ, 2000 model). I have 3 questions, which I hope someone can help me with:

First, is this as decent a radio as I'm being led to believe, and how do these radios (which operate on 66-88MHz, 134-174MHz and 403-470MHz) compare to normal CB's?

Next, can it be instally to interrupt the car radio/cassette deck (much as a mobile phone car-kit does)? I have the standard Chrylser radio that's in the year 2000 model TJ's.

Third, can the GM900 be modified to be compatible with CB frequencies, and which frequency ranges are normally used by standard CB's?

Later!

Michael Wittenburg

You didn't mention which Jeep you have. If you have a TJ, look on page
147 of the spring 2000 Quadratec catalog. I wouldn't buy the mount from
them because a local dealer has it for $20.00 not $99.95. That is the
mount I'm putting on next. No drilling! Some things in that catalog are
way overpriced.

If you've read through the newsgroup, or even this thread, you've
probably picked up on the animosity between CB and HAM operators. It
gets bad at times. I've seen some CB/HAM flame wars get 300+ posts long.
If you can wade trough the usual bullshit between CB'ers and HAM's,
as well as the right-wing/left-wing radicals (in both groups), and you
can usually get some pretty good help/advice.
What most things come down to is this: "How do *you* use *your* CB?".
Not much else matters.
What some one else does with their CB? Fine when its all said and
done, but it doesn't really help *you* out all that much, unless you're
looking to assemble a setup like "that guy down the road".

Long and short of it is this:
Yes you can talk "long" distances on a CB. However, you're limited to
a little over 150 miles. The FCC expects you to do that with 4 watts of
power on the regular 40 and 12 watts PEP on upper/lower sidebands.
Without skip there's not much of a chance of talking that far, legally
anyway.
CB is very informal. HAM bands range from formal to somewhat informal.
HAM is a hobby that'll cost you money to get into and run the bill up in
equipment costs.

Word to the wise, if you're thinking about getting into HAM, wait until
after mid-April.

Just my 2¢,

Yep, I have a 99TJ. That price is crazy just for the mount, I would guess that it is an error. But bumper mounts are not all that great either. You will need a very long antenna and many Jeep clubs do not allow long whips or require that they be tied down. Besides, how many of us still have the factory bumpers? :-).

Bob,

> What would be the best CB radio to use to reach shore and,
>then some, and what would be the simplest source of continuous electricity?
I don't see anyone coming back to you on the easy ways of charging.

You may consider either the solar route or, what I feel would be better
on your typical island environment, a marine wind generator to keep the
charge topped up in a battery or two.

Hey, you could probably run a small heater at the same time.

There's normally enough wind around, day and night, unlike sunlight for
the solar cells.

Michael,

>First, is this as decent a radio as I'm being led to believe, and how do
>these radios (which operate on 66-88MHz, 134-174MHz and 403-470MHz) compare
>to normal CB's?
Yes, it is a decent radio. There's little comparison with CB's. They run
more power out and are generally built to a higher spec and better build
quality.
>Next, can it be instally to interrupt the car radio/cassette deck (much as a
>mobile phone car-kit does)? I have the standard Chrylser radio that's in the
>year 2000 model TJ's.
Not that easy, but I'm sure a competent tech could arrange this for you.
Be prepared to pay.
>Third, can the GM900 be modified to be compatible with CB frequencies, and
>which frequency ranges are normally used by standard CB's?
The simple answer is no, not without a total redesign. Cb frequencies
are different in countries around the globe but by far the most common
is 27Mhz.

Out of the three bands available on that LMR/PMR low band, or 66-88Mhz
seems to offer the best range but the antennas are fairly tall. There
are no 'gain' antennas for mobiles.

If you want access to Cb freq's best bet is carry two radio's.
I've just noted your web site URL, S. Africa I believe.

Hope I've helped somewhat.

Brian:

Hamm4Fun needs to re-read the ARRL Antenna handbook one more time and
not just skim through it. The original poster probably trimmed his coax
to be resonate at the center of his operating range. Ok, so far; but do-
n't you almost have to throw at least one jumper in between the exciter
(sic. Radio) and the amp. Ah, haw; we've just added more coaxial length.
And I don't know about everyone else, but I keep a Cherokee peak reading
watt-bridge between the amp and the antenna. More coaxial has been added
again. But the antenna is looking at a longer coaxial length that is not
a 1/2 wave length or multiple there of. And I have found out over the
last 20+ years that most extrenal amps are VERY sensitive about the len-
gth of coaxial between the exciter and the input of the amp. Sounds like
the man needs to experiment with his feed line. And Hamm4Fun needs to go
back to the ARRL Antenna handbook. Other than the King James Version,
this is my second Bible. My first carries a '58 copyright second is a
'72 and the last is '99. Flame Not, Experience Yes! Al-American Eagle360
-Artesia,NM 73s-51s + Good DXing

3798. SWR Defined...

Newsgroup: rec.radio.cb
Date: 2000-03-09 00:00:00 UTC
From: Brian Griffey <bgriffey@kwom.com>
Message-ID: <EmSx4.11535$DF2.1634696@tw12.nn.bcandid.com>
Source record: 26438

The "Voltage Standing Wave Ratio" (VSWR) is the ratio of maximum ac voltage amplitude, as we move along the line, to the minimum ac voltage amplitude (which occurs 1/4 wavelength away from the maximum) and is related to the magnitude of the reflection coefficient |gamma| by VSWR = (1+|gamma|)/(1-|gamma|) or (1+|s|)/(1-|s|). It is a sensitive indicator of mismatch on a line. For example, if 1% of the incident power is reflected from a certain load, then |s|^2 = 1/100 and |s| = 1/10 so that the VSWR = 1.1/0.9 = 1.2 about. Of course if no power is reflected at all then |s| = 0 and the VSWR = 1.

3799. Could be very helpful to designers...

\We're selling our 3 most popular CB books as a special combo on EBAY. Here's your chance to save up to HALF the $80 list price. The books included are:

BOOK #1: THE "SCREWDRIVER EXPERT'S" GUIDE To Peaking Out & Repairing CB Radios by Lou Franklin. List $22. The most popular "big dummy's" guide ever published on do-it-yourself CB repairs & modifications. Covers peaking of receivers, transmitters, modulation, mike problems, antenna & SWR problems, detailed frequency modifications for both crystal & PLL radios. Loaded with charts, illustrations, and specific instructions for most brands including the new export models. This latest edition also covers slider and broadbanding tricks, FM conversions, and much more!

BOOK #2: THE CB PLL DATA BOOK by Lou Franklin. List $20. The only complete reference source on CB PLL synthesizer circuits ever published! Detailed PLL theory explained in layman's terms. How they work, and how to modify them for many more channels. Includes specific PLL block mixing diagrams, truth charts, & IC pin function diagrams for nearly every PLL chip ever used. Covers all the most popular U.S. & export chassis, with specific listings of all models using the chip.

BOOK #3: UNDERSTANDING & REPAIRING CB RADIOS by Lou Franklin. List $38. Giant 370-page technical book for the professional repairman. Picks up where the "SCREWDRIVER EXPERT'S" GUIDE leaves off. Includes circuit descriptions & troubleshooting guide for 23- & 40-Ch., crystal & PLL, solid-state & tube, AM, FM, SSB, CW, American & export models. Covers test equipment (& where to find it), transistor basics, synthesizers, receivers, transmitters, power supplies, T/R switching, antennas, interference, parts & accessory sources. Over 350 illustrations including schematics, charts, and photos. Huge subject index also lets you look up repairs by symptoms. This is "must" reading for any serious CB technician!

You can see exactly what these books look like, plus all the specific, chapter-by-chapter details at our Web site:
www.cbcintl.com

****
WHO ARE WE?

Since 1976 we've been the leading supplier of books, plans, and kits for CB radio. Do-it-yourself repairs and modifications, 10-Meter Ham conversions, amplifiers, FM converters, bleedover filters, adding new frequencies, etc. Secrets of how to increase your power, range, and

privacy.

Also keep in mind whether or not the phone is a spread spectrum phone or not. Spread spectrum phones are more expensive, but have greater range. The 1.2 GHz phones will usually have more range than the 900 MHz phones.

To Whiskey. Don't waste your time calling a lawyer. Unless you have proof (like an ER visit or doctor visit) that the rat tail caused physical harm you don't have a case.The best thing to do is contact your local Frito-Lay distributor or call the number on the bag and tell them what you found. In most cases they will compensate you for your problem. I worked for Pepsi-Co for 20 years and have seen things like this many times. People were always looking for an easy buck and getting lawyers and threating to sue only to find out they didn't have a case because they didn't have any actual health problems caused by their finds. Sugar mold growing in a bottle due to an improper sealing cap is always the big find, and yes it looks nasty but it's harmless. Rat tails on the otherhand may not be and could contaminate the contents of the bag. I hope you or whomever ate the chips didn't become ill. Best regards.

Hey guys,
I have ran dc for years now. I talked on a ac mobile one time and had a ball. I am very interested in running ac in my suburban. I would like some input from some of you that are into ac stuff. I would like to debate AC VS. DC.

I've been trying to find a mount for my wife's TJ. I have narrowed it down to 2. One is available from Turbo City in Orange, CA. It uses the existing holes of the tail light assembly on the driver's side. It runs for $15.95. The second one is sold in Northern California (The only place I've seen it sold on the web), and I don't seem to be able to locate the webpage right now, but I'll look for it and let you know if you are interested. It mounts on the front driver side fender, and the mounting screws are covered by the hood when it is closed.

FCC Levies Hefty Fine on Former Amateur
NEWINGTON, CT, Mar 9, 2000--The FCC has told a former Houston, Texas, amateur that he's liable for a $17,000 fine for unlicensed operation and for failing to allow the FCC to inspect his radio equipment. A Notice of Apparent Liability for Forfeiture--an NAL--was sent March 3 to Leonard D. Martin, formerly KC5WHN, by the FCC's Houston Office.

Martin has bumped heads with the FCC on several occasions in the past two years. The FCC said it received a written complaint in May 1998 alleging that a station identifying as KC5WHN was operating on frequencies not authorized by his Technician class license. The FCC's Riley Hollingsworth sent Martin a Warning Notice in November 1998 outlining the complaints. In a subsequent telephone conversation with Hollingsworth, the FCC says, Martin "generally denied the unauthorized operation."

In February 1999, an FCC agent using mobile automatic direction finding equipment observed voice transmissions on 27.545 and 27.535 MHz--channels allocated to the US government and the Industrial Radio Service respectively. The FCC says the station failed to identify but responded to the name "Leonard." The FCC agent determined that the source of the transmissions was an antenna at Martin's residence.

The following month, the FCC monitored voice transmissions on 27.370 MHz--a CB "guard channel." Again, the station identified with the name "Leonard." Again, the agent tracked the source of the transmissions to Martin's residence. The agent knocked on the door, was met by Martin, and requested to inspect Martin's radio station. Martin reportedly refused. The agent advised Martin that operation on the 27 MHz frequencies was illegal because he had no FCC license to operate on those frequencies, and that his refusal to allow an inspection was also a violation.

The FCC's Houston Office issued Martin an Official Notice of Violation last April. Martin replied by letter, acknowledging that he understood that operating on the frequencies in question was a violation and that the FCC has full inspection authority. He also promised that "no further action by the Commission" would be necessary to ensure his compliance with the FCC rules. In July, Martin turned in his Amateur Radio license for cancellation. He was again warned about unlicensed radio operation.

Martin's troubles didn't end there, however. Last October, following up on complaints of RF interference to a telephone in Martin's neighborhood, the FCC again tracked transmissions on 27.535 MHz to Martin's residence. At the same time, the agent also observed the RF interference on the neighbor's telephone. Later that same month, the FCC monitored voice transmissions on 27.455 MHz that were tracked to Martin's residence.

Again, the agent knocked on Martin's door and asked Martin to inspect his radio equipment. Martin reportedly again refused, telling the agent he believed he was being "unfairly targeted for enforcement" because many other operators also transmitted on unauthorized frequencies.

The FCC NAL said that, based on the evidence, Martin "repeatedly and willfully" violated Section 301 of the Communications Act by operating without an FCC license and by refusing to allow an FCC inspection of his radio station.

"Martin's violations were repeated and willful, and resulted in harm in the form of electronic interference to neighbors' home electronic equipment," the FCC said in the NAL. "Martin was advised of these violations numerous times, both orally and in writing, by Commission representatives and Martin indicated that he fully understood the requirements of the Act. Martin repeated the violations after receiving these warnings." The FCC said that applying its Forfeiture Policy Statement and statutory factors to the case, a $17,000 forfeiture is warranted.

The $17,000 fine is the third major forfeiture levied in recent months in an Amateur Radio-related case. Martin has 30 days to pay or to request reduction or cancellation of the proposed forfeiture.

I have a Cobra 148 GTL made in the Phillipiens. If anyone knows any good power mods they would be helpful. The radio is used mostly on SSB. Also I am looking for a good 120-250 watt amp to use with this radio, again on SSB. Any recomendations?

3819. Re: "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38c856bd.1070545@news.iserv.net>
Source record: 26338

Greetings!

Hey! Wait a minute!

Tmon and some others are onto something here...

What occurs when RF voltage within the SWR meter leaks past it's
shielding?

Poor SWR readings...

Unless you have a high quality shielded meter, RF flowing across the
measuring point can actually encroach onto the meters own sensing
circuits, including the meters own coil wind.

Since the subject of what type of SWR meter he was using is not known,
we are only speculating...

However, SWR should be measured at the radio's own output with the amp
on. If any reflections occur, this mis-match can be amplified very
easily on the other side or the amp, at the output.

And if the SWR meter is not designed to read high power, the problem
can be from the meter, or the amp.

To determine if its' the amp or not, is to use a separate
antenna on this same system to see how it reacts...

If you use a Firestik, try a Penetrator, or at least a
Firestik of a different length.

Tune the antenna using just the radio. And then see if this
SWR problem returns with this different antenna. If it does'
the amp is highly reactive to the loading the antenna
provides and the radio reacts to both.

You may need to re-work the set-up, don't throw out the amp with the
rest of the system just yet. I recommend a serious upgrade to the
system including some real physical help in visualizing the system and
getting a good tech to help you install this beast properly - at home!

The internet can only help so far...

Hope this helps...

On Tue, 07 Mar 2000 18:40:00 -0500, while the modem was pondering it's
navel, tnom@mucks.net dissertated the following:

Greetings!

An interesting radio...

I don't particularly like the receive performance on the radio
regarding the noise reduction circuits...panel buttons and faceplate
can use a little help and more room.

Dynamite for a Base radio...need at least a 10 amp power supply for
that little night light with current muncher circuitry...

Mobile? Wouldn't recommend it. It's got a lot going for it, but a
frail assembly and chassis design with some PC board re-work right out
of the factory does tend to remind me that you pay an awful lot for a
radio that many other radios can outperform it in many aspects without
all the bugs...

Since you mentioned a 2950 - If it came to splitting hairs, but the
2950 and you'll be a lot more satisfied with the price you paid for
the performance you get...

Message-ID: <38c85d64.2773205@news.iserv.net>
Source record: 26346

Greetings!

Although the "tech" may have some basis of fact for the story, it's
not necessary to "tune the radio 500KHz higher" - you'll only wind up
being eve further off frequency...

The basis of fact is due to when the radio is just starting to warm up
and the oscillator section that give you the frequencies is not quite
stable.

Some radios cold-start out *below* center frequency, while others are
slighlty above. When the radio warms up, this drift wil bring the
radio back to "center-slot".

To witness this, grab the radio and throw it in the freezer for 1/2
hour, then while it's still ice cold, use a frequency counter to see
it's output frequency...then leave it keyed up for about 10 minutes
into a dummy load and then re-check the frequency...you'll see why the
idea of "pre-drifting" the radio to bring it to center slot makes
sense for people living above the arctic circle, but for the rest of
us in the temperate, sub-tropical zones don't need to waste our money
on such a tune-up...

Disclaimer...

Freezing a radio is not covered under warranty!

Source record: 26348

Greetings!

Most radios use a static supressor resistor *across* the radios
antenna leads...this may lead to the "short" you're reading...it's no
less than 4.7Kohms on R/S radios, or 10Kohms [10,000 ohms or 10 on the
meters 1,000X scale] on Uniden/Cobra or Midland radios.

The reason for the difference is due to emission and noise
rejection figures the Radio Shack prides itself on and
this resistor does not drastically affect receiver performance
unless it's blown and then static build up can occur causing
a more serious receiver problem...

OR!!!!

The radio may have an internal short and should be checked by a local
tech. A short can be determined by using your ohmmeter across the
center to shield of the SO-239 connector on the back of the radio.

If it shows a short - get it to a tech quick before the radio does
quit on you...

It is also not impossible that the mount or the connectors, when
pressure from mating the two parts together, can compress the shield
and braid together, causing the short.

Or, the tailgate may not provide enough counterpoise ground and a
braided jumper between a bolt on the tailgate, to the frame of the
jeep can help low that SWR problem.

Greetings!

Dont forget...

Standing Wave Ratio, is the measurement of Forward RF power to
Reflected power.

or SWR = Pfwd/Pref

You didn't mention that in your post.

On Thu, 09 Mar 2000 18:49:08 GMT, while the modem was pondering it's
navel, "Brian Griffey" <bgriffey@kwom.com> dissertated the following:

>The "Voltage Standing Wave Ratio" (VSWR) is the ratio of maximum ac voltage
>amplitude, as we move along the line, to the minimum ac voltage amplitude
>(which occurs 1/4 wavelength away from the maximum) and is related to the
>magnitude of the reflection coefficient |gamma| by VSWR =
>(1+|gamma|)/(1-|gamma|) or (1+|s|)/(1-|s|). It is a sensitive indicator of
>mismatch on a line. For example, if 1% of the incident power is reflected
>from a certain load, then |s|^2 = 1/100 and |s| = 1/10 so that the VSWR =
>1.1/0.9 = 1.2 about. Of course if no power is reflected at all then |s| = 0
>and the VSWR = 1.

Message-ID: <38c8631e.4240035@news.iserv.net>
Source record: 26450

Greetings!

Base or mobile?

If it's a base, you might have a ground loop problem with the antenna jack of the radio [shield] and the ground side of the power supply may cause the ground loop.

In mobiles, this type of hum may be an RF squeal just at the point of self-oscillation - where RF is leaking into the audio portion of the circuits and causes this hum - another type of ground loop known as poor RF shielding.

I'd double check the wiring of the mike and ensure that the audio ground and RX/TX switching grounds are kept separate if need be. Otherwise use the braid of the audio as the complete ground for the mike to the radio to help provide shielding and proper RF and electrical return ground.

On Thu, 9 Mar 2000 17:54:33 -0800 (PST), while the modem was pondering it's navel, UNOULIKE@webtv.net dissertated the following:

>My radio has a hum while in transmit mode. If i touch the back of the
>radio while i am transmitting the hum goes away. How can i get rid of
>this hum?? The microphone is wired correctly, and has really good audio
>otherwise. What kind of grounding solution can i resort to...since the
>hum does go away when i touch the back of the radio i am assuming that
>this is ground problem of some sort. I tried an electrolitic capacitor
>on the output terminals of my power supply....nothing. Any ideas??
>Thanks

3832. Re: Help, speaker squealing

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38c8644b.4541140@news.iserv.net>
Source record: 26451

Greetings!

Check the radio, you may have talkback in the CB, causing you to
squeal with both the internal speaker and external one being so close.

Not sure of the CB radio you're using so the above is just a guess.

Does the CB squeal when this setup is active and with the 2M radio on?

Then a separate problem of shielding is coming into play.

The 2M radio may not be able to completely reject the CB RF out of
it's own audio amp circuits, causing this squeal.

Another factor...

Impedance...

The speakers for both radios should be around 8 ohms, with some CB's
using 16 ohm speakers. If the CB radio and the 2M are hooked up to the
same speaker, a dropping resistor should be used to help balance the
impedance between both units and can reduce this squeal problem.

An 8 ohm 2 watt resistor IN-LINE to the ext speaker outputs [this
means working on the inside of the radios] on *both* would provide
enough impedance to lessen this squeal effect.

On Thu, 09 Mar 2000 18:16:57 -0800, while the modem was pondering it's
navel, Hutch <hutchgNOhuSPAM@earthlink.net.invalid> dissertated the
following:

>>3pill mobile or base can do 600 watts.

BODINE! Give me a break. The boards look like somebody took a dump with solder coming out of their but, thing might do 600w out of three pills but on how many freq's??? Bodine took TNT boxes and tried to bo something diff. with them. The reason Bodine's USED to win back in the 80's before Dave made the scene is because he was volting when all the other yeehas didn't know what it was about. Dave came around the Mid-Atlantic around mid to late 80's and cleaned up mostly. The Dave dominance remained until the past two years.

3841. X FORCE SIDE BAND CLASS "B" EUROPEAN AMPLIFIERS

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: xforceamps@aol.com
Message-ID: <20000309234830.17323.00002289@ng-xe1.aol.com>
Source record: 26460

X FORCE
SIDE BAND CLASS "B" EUROPEAN AMPLIFIERS

20012 AMP Requires 15 watts avg. to 25 watts avg. of drive from your H.F. rig. This will drive two 2sc2879 transistors Output watts will avg. 200 watts rms . Your output power is 600 watts peak @ 14.8 vdc. This amp will require 50 amps continuous duty from your alternator or power supply.

40012 AMP Requires 25 watts avg. to 35 watts avg. of drive from your H.F. rig. This will drive four 2SC2879 transistors. Output watts will avg. 400 watts rms. Your output power is 1200 watts peak @ 14.8 vdc. This amp will require 100 amps continuous duty from your alternator or power supply.

60012 AMP Requires 35 watts avg. to 50 watts avg. of drive from your H.F. rig. This will drive six 2SC2879 transistors. Output watts will avg. 600 watts rms. Your output power is 1800 watts peak @ 14.8 vdc. This amp will require 150 amps continuous duty from your alternator or power supply

80012 AMP Requires 35 watts avg. to 50 watts avg. of drive from your H.F. rig. This will drive eight 2SC2879 transistors. Output watts will avg. 800 watts rms. Your output power is 2400 watts peak @ 14.8 vdc. This amp will require 200 amps continuous duty from your alternator or power supply.

120012 AMP Requires 35 watts avg. to 50 watts avg. of drive from your H.F. rig. This will drive twelve 2SC2879 transistors. Output watts will avg. 1200 watts rms. Your output power is 3600 watts peak @ 14.8 vdc. This amp will require 300 amps continuous duty from your alternator or power supply.

160012 AMP Requires 40 watts avg., to 75 watts avg. of drive from your H.F. rig. This will drive sixteen 2SC2879 transistors. Output watts will avg. 1600 watts rms. Your output power is 4800 watts peak @ 14.8 vdc. This amp will require 400 amps continuous duty from you alternator or power supply.

Note: The 20012 and the 40012 both come with one cooling fan mounted for ample air flow and low wind noise, automatic ssb delay and remote jack (remotes available from the factory). All amps come equipped with a thermal protection circuit. The unit will no longer produce wattage when 175 degrees F. is reached and a protection light will illuminate (which is mounted on the face) (this circuit was designed for the prevention of overheating the transistors). The 60012 has two fans and the 120012 and 160012 are equipped with four cooling fans mounted for maximum cooling air flow and the same features as the smaller units. For the larger units batteries can be supplemented for the lack of

amperage produced by the alternator in your vehicle.

Be sure your antenna vswr. does not exceed 1.3 when amp is in operation and on.
recommended coax lengths : From your H.F. rig to the input of the amp 12 or
18 feet.
From output of amp to the
antenna 12 to 18 feet (see note below)
NOTE: we strongly suggest
the use of a watt meter that is capable of
handling the high output
wattage these amps will deliver.
From amp to meter 12 feet
of coax and 12 or 18 feet of coax from
meter to the antenna.

THANK YOU
X FORCE

Message-ID: <pp%x4.688$oN5.169900@tw11.nn.bcandid.com>
Source record: 26463

Open the set up. Turn it on. Using something that is non-conductive, a wooden pencil with a rubber eraser will work, press lightly in the area of the printed circuit board that feeds the speaker. While you are at it check the wires on the speaker. You should be able to work your way to the trouble spot. A magnifier of some type will help you see the bad joint. If you fine the area but can't see it try touching it with a soldering iron. Use as little heat as possible. Quick in and quick out with the iron.

I just had about 3 or 4 Midland sets with the same problem.

Hope this helps.

:>not be in the simple form they are. They would have to have an axis for
:>the input mismatch.
:>
:>--
:>Bill Nelson (billn@peak.org)

: Actually there are no losses directly attributed to standing waves.The presence
: of standing waves does increase other losses, such as dielectric and resistive
: losses.

But it is the SWR that causes these additional losses - which means, at least
to me, that they ARE directly attributed to SWR.

3847. Re: "Deluxe 400" with high SWR problem

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <8aa0ncqvu5@bashir.peak.org>
Source record: 26466

Handy Andy <CodysPC@iserve.net> wrote:

: However, SWR should be measured at the radio's own output with the amp
: on. If any reflections occur, this mis-match can be amplified very
: easily on the other side or the amp, at the output.

This is incorrect. Here is an example why:

Assume that you have a perfectly matched antenna (to the coax). It does
not matter what the output impedance of the amp is, there will not be
any measurable SWR.

Now, assume that you are using 50 ohm coax between the transmitter and
the amp, but the amp has an input impedance of 25 ohms. You will now
read a 2:1 SWR when measuring it at the output of the radio. Measure
at the output of the amp and it reads 1:1.

Further, when you bypass the amp - assuming that the bypass is 50 ohm
impedance (unlikely), then the SWR would again read 1:1.

In other words, SWR is not passed through an amp.

In all cases, we are assuming a clean signal with proper harmonic
suppression and no overmodulation.

: Tune the antenna using just the radio. And then see if this
: SWR problem returns with this different antenna. If it does'
: the amp is highly reactive to the loading the antenna
: provides and the radio reacts to both.

If the antenna is tuned without the amp in the line (completely
removed), then there should not be any increase in SWR when the
amp is placed in line. If there is, then the input to the amp
is not 50 ohm. This assumes that you are measuring the SWR at
the output of the transmitter.

Andy <RIRadio@mailandnews.com> wrote:

: How do YOU determine % of modulation? I use a high quality meter with
: SWR/Power (10/100/1000 watts)/Modulation and it seems pretty accurate...

Such a modulation meter is accurate when using a sine wave as the test signal. It is not accurate with a voice signal.

The only proper way of checking modulation percentage is with a good scope.

---> Equipment For Sale <------

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition-
with copy of manual $250.00 SOLD

Alinco DR110, 2 meter mobile, 45 Watts Good Condition $110.00

Siltronics Mdl 90 -6 VFO $70.00

Siltronics Mdl 90 -3 VFO $70.00

Turner Plus Three amplified Desk Mic, Grey Model $35.00

Shure 777S Slim Crystal Broadcast Microphone, Original box and accesories, With
Radio Shack Base and Goose Neck $90.00

Kenwood PB-18 HT Battery 7.2V 1100mAh, Like New in box hardly used $35.00

Kenwood PB-17 HT Battery, 12V 700mAh, Like New in Box hardly used $45.00

Kenwood PB-13 HT Battery, 7.2V 700 mAh, Untested $10.00

Kenwood PB-32 HT Battery, 6V 600mAh, Untested $10.00

Cobra CAM88 Tube CB Base, 23 Channel Working, No Mic but I have the Mic Plug
with it and copy of the SAMs. $65.00

Realistic Navaho TRC-30 Base, 23 channel, Works good $30.00

RT-524 30-76 Mhz Military FM transceiver, Good condition an 8 on a 1-10 scale,
No nomenclature tag (desirable for collectors) Replaced with Serial Tag.
Manuals and original mic. $500.00 See Fair Radio Catalog for more info. Their
Price $625.00-$675.00

Swan 1200W 10-80 Meter Amplifier, Very Clean Condition, Uses 4 6LQ6 Tubes
With Manual. $250.00 Obo Pic will be on the WebSite Soon! Will trade for a
Kenwood TS520. SOLD

Yaesu XF-32A SSB filter for FT101 series, $40.00

Tram D201 Parts, Wood End Caps, Meters, Crystal/selecter Board, Transformers,
Face Plate, Knobs, crystal filter, Etc... Inquire with your needs,.

Misc. 24V Switching power Supplies, Cosel, Power One Etc... Most new in the box

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00 Obo

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced! (Pending Sale)

Commercial VHF Handhelds:
Motorola Radius P50 (Weak Battery)
reasonable offer SOLD

Kenwood TK240 Commercial VHF Handheld with drop in charger, great battery,
great condition.
Reasonable offer (Pending Sale)

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $130.00 Reduced to $100.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00 SOLD

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Icom IC-230 with manual, mic and mobile bracket. not working correctly, VCO
unlocks but in great cosmetic condition,, $30.00 Shipped

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and
D104 Mic $250.00 Pic will be on the Website Soon !

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required, super clean! $150.00

Yamaha FG-460S-12S, 12 String Guitar, Beautiful guitar, near flawless, Gold
hardware, Pearl inlay, Seymore Duncan Acoustic Pick-up, Hard Case $350.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics
Meter, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, clean!, Surplus, As Is
$40.00

Alan K1313 10 meter Single Tube Modulator, 110 VAC, With Spare 6KG6 tube, New Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a Demco Tube Modulator. Smooth Clear Audio! $200.00 Obo

Pentax K1000 35mm Camera, Wide and normal lens, 2x teleconverter. Cokin filter holder with flare guard. Several special effect Cokin Filters, polorizers and acessories, carrying case etc... $250.00 Obo

SBE Trinidad , 23 channel base CB, near perfect condition, original manual $70.00

Fluke 8050A Digital Desktop Multimeter, AC/Batt, needs new batt. but works great on AC $50.00

NF Circuit Design Block Model CR-116 Low Distortion Signal Generator, $125.00 Obo

Misc, Yaesu FT101 Components and parts, Misc untested boards, Email If you need something.

Electrovoice Mic.... See Website!

Misc 19" Racks..... Email for Details

Will Trade For Mustang 5.0 Parts Or??

To see this Equipment and More equipment and Pics go to:

http://members.aol.com/radiodoc37/indexdoc.html

Modified components to build your own Rife-Bare
Resonant Frequency Therapy Machine, Modified
ISM transmitter, Modified Class C amplifiers,
And a variety of Plasma Tubes. Built and tested
systems available.
To Learn about Plasma Wave Therapy See My site:

http://www.medicineofthefuture.com

All items shipped UPS ground after reciept
of MO Or cleared Ca. Check.
Thanks
Mike

This Alternator is the 130 amp model, with a voltage regulator that can be disconnected, or bypassed. This unit is in 100% Brand-New condition, still in the plastic--and will be shipped in the original factory carton...price is--$165.00 + shipping.....SERIOUS replies only!!! Please E Mail for further details.....Thanks.

For practical purposes you are right. But I see a lot of people giving out info on SWR losses that is just plain wrong. Mostly what I hear is that if you have X SWR on the line then you will have Y losses. This depends on the quality of cable you are using and not solely on the SWR. As an example on coax the losses can be significant but on open wire even a 10:1 SWR will effect the losses very little. Just another part of the SWR picture.

I am impressed with them. The only drawback is you have to spin the hell out of the alternators. At the last shoot-out we just had, one was about 150 yards away from me. He was doing some testing and fully keyed up my boxes! Most of the time when that happens it makes the boxes chatter, this time all I heard was click.

Changing the coax length does not change the SWR. It will change the impedance the transmitter or amp sees at the end of the coax. At least it will if there are standing waves on the line. Unless you are using a slotted line the meter you are using is not measuring SWR.. All it is really doing is comparing the impedance it sees at the point it is mounted in the line to 50 ohms or whatever impedance the meter is designed for and reading this out as SWR. This is true even for a Bird. The reason the SWR between the amp and radio appears to change when you change the length of the cable is because of the poor match the input of the amp is to the impedance of the coax. I am not saying there is anything wrong with using a trimmed length of coax to match the radio to the amp, just that changing the length does not change the SWR. If you can not agree with this just site the page in the 99 issue that shows me where I am wrong and I will apologize and chalk it up to experience. I know I haven't learned all there is in over 30 years.

If you remove the plastic end caps from your rear bumper, you can
drill out one of the holes and fit a 21-961 ($4.99) feedthrough
from Rat Shack. It's been holding a KW-7 for 2 years. I had to
ground it with some copper braid because the constant movement
and dirt made the ground connection come loose.

When you say you have no audio yet you have good receive, do you mean
it receives good but without receive audio?

Try the PA and see if you have audio there. If not, then you need to
replace the audio chip.

Hi,
Many thanks to all who responded to my last mail.
One of my biggest problems is that "something"
drains the battery. On principle I am thinking
that the CPU (IC601) is slighly broken, but ...
A lot of people claim that if one leaves the radio
turned ON while the power supply if OFF ... the
battery will go dead. I wonder why. I cannot find
the way it should happen. From what I can see
looking at the schematics there should be NO
difference whether the radio is turned OFF or
whether the power supply if turned OFF.
Could someone, please, explain me why should the
battery be drained when the radio is left ON while
the power supply is OFF ?
Well, if this is really true, then ... maybe the
CPU is o.k., but ... it does NOT see that the
power is gone and it still tries to "work" ?
Understanding the way the CPU is expected to go
"sleep" would help me a lot.
Thanks in advance,
Jacek.

Sorry, but check the definition od the word ratio...

Quoted from PC dictionary Word Web Pro 1.6...
The relative magnitudes of two quantities (usually expressed
as a quotient)
...magnitude relation.

Under types is "reflective power"
...Unquote

This person IS right!
Cheers,
John

I have a Leece 130 for sale.100% Brand-new in the box, still wrapped in the plastic......Will power an 8 pill @ 16V, or you can get an external voltage regulator--and go nuts with a 4 pill (22V +), and AMAZE your friends!!

The price on the alt is...$165 + shipping.
The unit weighs 20.75 lbs. SERIOUS replies only......E Mail for further details....

Thanks for the reply, HandyAndy,

The radio is a Uniden PC66XL, I don't think it has "talkback".
I guess I would know if it did.

The squeal happens even with the 2M turned off and there is no
change with the 2M on.

Is there a way to "shield" the speaker?

Thanks
Hutch

it could be the chip. but sometimes the ext skr plug breaks
loose from the board causing loss of audio....check that
also....and check the speaker too, always check the easy stuff
first....you don't want to go in and change a chip just to find
out that that wasn't the problem anyway.... and check pin 4 of
the audio chip they are known to come loose....

THATS RIGHT.....He's a newbie and he's out here with the big boys who have been out here for years and trying to brag about something new that he knows about. What he should be doing is trying to check his ego and humble himself a little and perhaps he can learn and achieve so much more in the hobby by being quiet and just start listening.

The amps are becoming so close in producing the same numbers that its not always going to be the box that is going to win keydowns, Its going to be everything else, antenna systems, voltage systems, audio and such.

KRS

well that is all very interesting but i think these ac mobiles are a
bigger pain the ass than dc is, i don't care what the rf power output
situation is. not only that but it would be unconfortable for me to sit
in a vehicle which is serving as the ground for 4000 or whatever volts.
somehow, it would make me nervous. but it all depends what you want. i
think this ac stuff is for keydowns and pulling off somewhere and
talking skip. i haven't got the patience for it nor the time, so for
me , just flipping a switch and being able to talk is where it is and
don't for a minute think that big dc can't put the hurt on ac, at least

sometimes that is,....cd is out......

3892. Mobile mounting options

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: Jeff Boone <jeff@steptech.com>
Message-ID: <8ab5tpiac1@news.chatlink.com>
Source record: 26511

I need to install a CB in my truck, and I'm looking for a way to mount the thing. Like most (all?) newer vehicles, the dashboard is all plastic, so it doesn't provide a good place to bolt on the regular mounting bracket.

I think I'm looking for something that rides on the transmission hump, but the only options I've been able to find locally are plastic bases that just sit there. Mount a heavy radio on one of them, and any hard turn or sudden stop will have things flying around the cab. Does anybody sell a bracket than screws to the hump? Or, some other suggestion? Thanks...

Jeff

Cactus,

>Butter bean there is no comparison, you can easily get 10kw out of ac amp
>using 1 alternator, but you cannot say the same for dc powa
I'm impressed!

I was under the impression that with a single alternator (highest output Electrodyne) and say a 3CX3000A7 you could see around 6K Bird watts.

Tell us what setup I need to see a higher output with a 43 and a single alternator?

Tnx

Phil 148 / UK

Yes... all that plastic is a problem... but remember that all that plastic has a metal skeleton underneath. I have sucessfully installed many radios using that structure. The only mount I suggest for mobile operation is made by Gamber-Johnson(ding ding) and is very robust. It's also very dear... see http://www.gamberjohnson.com/index.cfm

Dividing the forward power by the reflected power does not give you the
SWR.

What kind of radio? If it isn't much bigger or heavier than a galaxy mobile radio, velcro tape works great. Have it in my 4x4 for quick removal and I run the hell out of the truck throughout the swamps, muddin' and boggin', hill climbin' and just about everything else. Just make sure you use enough of the tape.

Coax length makes a difference under any circumstances, not just in the case of a load imbalance. Think about it guys, does your radio know the difference (when either transmitting or receiving) between a length of coax with a 52ohm resistor in parallel, and an antenna array? So the informed operator trims his coax to the nearest 1/4 inch before soldering on a PL 259 and connecting the antenna.

Yes,
I built one a couple of years ago and it worked great.
It had four 2SC2879 and a regulated bias control.
They are not that hard to build either. He supplys
lengthy step by step instructions and plenty of
theory. If you like to build stuff you'll like this one.

phil , consider this a davemade ac mobile using , 1 -240/250 amp Leece neville and a 3cx3000a7 will yield considerably over 10kw on a bird 43.. I know there are other amps out there that will do this as well

123 , BB has already won many trophys with a davemade, and other amps, it is his antenna system that does it for him not your clone amps...., your amps do not show anymore watts than the rest of them .

If you didnt give BB his amps for free he would still win with what he already has. Get Real.....

Even though "SWR = Pfwd/Pref" was posted by Handy Andy
I don't believe he meant for that statement to be taken literally as a
proper math equation. Rather it was suppose to be just another way
of saying "Standing Wave Ratio, is the measurement of
Forward RF power to Reflected power." Which it is. It just
isn't a direct ratio.

This is not true, put a trimmer cap in the place of the output shunt of a
basic 2 pill design and trim it, watch the reflect on a bird meter and see
if it does not change. This will not work into dummy load, nor will it do it
on all amps, but just try it some day, you might be surprised.

Well...if i key the mic while adjusting the volume gain slider to zero, the hum goes away, but of course the RF field would be the same whether i modulate or not. The hum is not in the voice part of the transmission, but instead in the carrier. The mic is an Astatic 575M-6 and is wired and soldered properly.

3959. "Correct" coax length makes you rich.

Newsgroup: rec.radio.cb
Date: 2000-03-10 00:00:00 UTC
From: Bob <bob@bob.com>
Message-ID: <38C9C3E1.62F61D0C@bob.com>
Source record: 26678

Not only does "correct" coax length make a "critical difference to the efficiency of power transmission", it also makes you rich. There is also another study currently underway, trying to prove the "correct" coax length improves your vocabulary. It's simply amazing what the "correct" coax length can do.

Bob.

>

Its also interesing to note that when we measure SWR we are not measuring SWR at all. What we are really measuring is the impedance seen at the input to the feedline and comparing it to 50 ohms. This causes more confusion and misconceptions about SWR than anything else I know of. I know it confused me for a long time because what I was was seeing in real life did not appear to go alone with the books. Once I learned what the SWR meter was really telling me it all made sense then and the books were right. This "awakening" occured to me about 20 years ago.

Before doing all of this try two seperate speakers If the problem goes awy there could be some merit to the suggestions. If not you have other problems. Rgardless, both of the radios should not be connected directly to the same speaker. I would put about a 6db pad on the output of each radio.

I have known of the CG to monitor CB but this was a long time ago in CB's
hayday. I would check with CG to be sure. What you may really need is a marine
radio or a cell phone.

3983. Yes, 120 Channels w/Midland 75-820.

Newsgroup: rec.radio.cb
Date: 2000-03-11 00:00:00 UTC
From: Bob <bob@bob.com>
Message-ID: <38CA6DE0.786C1F7F@bob.com>
Source record: 26569

To answer my own question, since nobody else knows anything (about this). The 120 channel mod does work, the most important step being correctly resetting the CPU.

I believe the instructions here:

http://www.geocities.com/Pipeline/Rapids/8860/Mod/Midland/midland.htm

have INCORRECT information on resetting the CPU.

The instructions here:

http://www.bills2way.com/modification/mod_75820.html

have a better photo, but the accompanying text is still written by the the illiterate 3rd grader who is too non specific. I successfully reset the CPU by grounding point "E" (point "E" shown on the photo on bills2way page) to the negative point on the battery pack. I used alligator clips to connect up the battery pack to the radio while dissembled. After I got everything hooked up (using a small piece of #20 wire to connect point "E" to the negative terminal of the battery), I turned the power on momentarily, noting that the radio will not actually turn on with point "E" grounded. Turn the power knob back off, unhook your ground from point "E", then turn the radio back on an you now can scan above channel 40 and below channel 1, WITHOUT switching bands. When you are above channel 40 (27.405Mhz), the channel indicator places the letter "H" after the channel, when you are below channel 1 (26.965Mhz), the channel indicator places the letter

"L" after the channel. If you are in frequency readout mode instead of the channel mode, the actual frequency is displayed.

Also note, I skipped that part about the actual jumper for 120 channels because this is the obvious part given in the directions I found all over the web.

This is one sweet radio for the money.

Bob.

It's NOT funny. The alfa tangos are a worldwide dx group based in ITALY, where it is LEGAL to utilize this call frequency. Last count, the AT's in Italy are gathering info. and are or already have filed an international complaint with the FCC in the states alleging willful, wanton and malicious harassment and interference on this parasite that is on 555. Many hours of tapes were made in Italy(where I've been told it is LEGAL to tape with or without implied consent) that are being sent stateside to the Feds. It will be interesting when this little shit gets whats coming.

The antenna tuner will bring your match down and power up, but however
the actual radiated power will be less out of the antenna than if you
just left the tuner out.

But its still not a simple as you have tried to indicate. You
don't just divide one power by the other. Bill Nelson gave you the
correct formula to calculate SWR based on power measurements. By the
way its still a ratio, and a correct ratio when calculated correctly.
so it agrees with the definition in the dictionary.

In your previous post you said:
W6RCA has been reported to Hollingsworth for assisting in the illegal
modification of type accepted radio equipment.

I had a tech. work on a highly modified TS-520 once, and he told me
that to clear his responsibility for working on it, was to clearly tell
me that operating the equipment on 11 meters was illigal. Now how in the
hell do you get in trouble for simply pointing the way to the mod. sheet
posted on the web? Yeah, we need more people like yourself on the air
and on the web! Crawl your dumb ass back under the rock from which you
came troll and think with your OTHER head.

Hey Richard,

Get a life dick-head. This is the best compliment you will ever possibly
ever get on the air or off. People like you are possibly accountable for
at least 50% of the interference on the 11 meter band, sitting around
telling people engaged in a QSO that they are breaking the rules. When
in fact you are also engaged in a illegal act for going back to a oper-
ator (which you will never be one of) that is over the 155 mile range.
Kind of like the big 'ole black kettle calling the pot black.

4009. HELP with Microphone Settings

Newsgroup: rec.radio.cb
Date: 2000-03-11 00:00:00 UTC
From: Jim Teague <jteague@erols.com>
Message-ID: <38CAA04A.3AFD34A0@erols.com>
Source record: 26595

I recently purchased a Adonis 508-E (RF LIMITED) desk microphone.

It is being used with a Ranger RCI-2950 10 meter Radio.

While I love the microphones styling and its ability to change channels,

I'm very unhappy with the audio reports that I've received while using it. A day doesn't go by that I don't get a comment about the audio being distorted or "over-driven".

I've tried a varied of settings from setting the radio's mike-gain control down low and running the mike at higher levels, to setting the mike down and varying the radio's mike gain control. I've tried the Lower of the 2 compression settings and also varying between the FM and SSB settings. No setting appears to offer acceptable audio.

Any suggestions on improving the audio would be appreciated

For 120 watts, get a cheap boomer or palomar. Make sure it is class AB
for SSB use. You will need a delay on your keying relay for SSB. That
delay gets real annoying on AM, so a switch is nice for that.

Source record: 26597

I have a Leece/Neville 130A alternator. This one can be put in line with those adjustable, external voltage regulators; That the BIG amp companies sell...(It has a voltage regulator that can be bypassed)...It can power an 8 pill @ 15~16V, a 6 pill @ 18~20V, or you could STROKE the hell out of a 4 pill @ 22V + !!! (You will typicially see 750~800 rms watts, out of the better competition amplifiers out there, with 4) 2sc2879's @ 22~24V)..
This IS the brand you will see under the hoods of the competitors (at the CB breaks), across the country....

Impress your friends!!!!, MAUL your enemies!!!
Be the CHANNEL MASTER in your hometown!

Leece/Neville 130A alternator-100% Brand New
.in the box, still in the factory plastic..$165.00 or BEST OFFER.....Buyer pays ALL shipping charges....This unit weighs in @ 20.75 lbs!!!

I am in the ChicagoLand area, on the Indiana side.....I can ship it, or we can make other arrangements....E Mail me if intrested...Thanks.

In the January 2000 issue of CQ mag. page 15 sub-box it states that:
Riley Hollingsworth is the FCC's Special Counsel to Amateur Radio. DAH!
What does he have to do with 11 meter enforcement(not that we don't
need some), If you are going to talk out your ass it is important not to
sit on it as someone might be hearing impared and need to read your lips
fool!

But, MC has a better idea that is so simple it is complicated. The output impedance of your typical audio amplifier is going to be much less than 8 Ohms. In fact, it is well below 1 Ohm. By using the Y adapter you are providing very bad loads to both of your radios. This is not good. The cure is simple, run the hot (center) lead of one radio to one lead of the speaker and the hot lead of the other radio to the other speaker lead. This way the unused radio will -sink- the current from the one that is receiving and vice versa. No condition should exist that will cause a bad load to either radio.

Caution. Some radios use what is known as a BTL output. This type of amplifier has no ground reference so the above will not work. I've only seen professional two-way radios and car audio equipment with BTL outputs. BTL is used to get twice the output power out of an amplifier - or to use cheaper output devices (and twice as many of them) to generate more output. A typical CB will produce about 4W of audio. A BTL amplifier, employing bootstrapping techniques, can get well over 20W.

MC

>
> Bill
> >

Nonsense, SWR is determined by the match of the coax to the feedpoint of
the antenna, not by the length of the coax. Trimming coax to reduce the
SWR is another cb myth that causes much wasted effort.

4015. Re: high swr-- anyone help?

Newsgroup: rec.radio.cb
Date: 2000-03-11 00:00:00 UTC
From: John <mrbreezej@netscape.net>

Source record: 26601

In addition to your first response, a piece of 10AWG stranded copper wire with soldered lugs on both ends to the antenna ground and a good un-painted portion of the cab should solve the ground problem. But that will not solve the SWR problem if the antenna is laying up against the truck cab. It needs to be above the cab at a minimum. If it is a mid load, at least get the load above the cab body.

John

>What a waste of tax dollars! Does Riley call everyone?

Yep. He believes in "firing a warning shot across the bow". Some people clean up their act when they hear from him. Others decide to see how far they can push it. That's their right, I suppose. If you can't take the heat, stay out of the kitchen.

>I bet that guy doesn't pay 17 grand either.

I'll bet he does. If he's late, it's referred to the US Attorney's Office. If he ignores them, it's jail time (plus he STILL owes the fine). Maybe he will luck out like the lady CBer who pleaded with the judge that she didn't have $5,000 for her fine. She agreed to sell all her radios and likewise agreed to never purchase any more transmitting equipment, for life.

>How much does he make
>a year?

Forget Riley's salary. A better question is: How much does Leonard D. Martin make a year? Enough that he can afford to give the US Government $17,000, just for the priviledge of being stupid?

I can hear Martin's wife saying, "Great! You don't have any money to get the kids' teeth fixed, or to repair my car so it won't keep leaving me stranded on the Eastex Freeway. But you have seventeen thousand dollars to waste by playing with those #$&% radios and getting in trouble with the FCC!"

It's gonna be rough on ole Leonard, sleeping out in the dog house. The humidity in Houston makes it real sticky at night, this time of year.

: on all amps, but just try it some day, you might be surprised.

I am not sure what you are talking about here. It may change the matching
of the transmitter to the coax -- but it will not change the SWR. That
can only be due to the input impedance of the amp and the impedance of
the coax.

Cobra/Palomar XL-450, 4 Stage 12 Volt Amplifier

This is a 450 watt 4 Stage Amplifier. Low, Med, High,
and Max. You can put up to 4 watts AM into this amplifier.
This amplifier will have a forward swing of around 300 to
450 watts depending on how much power you put in. Normal
250 AM carrier with 4 watts drive. This amp also has a
pre-amp and SSB mode. This Amplifier is made for Cobra
by Palomar.

This Amplifier is Brand New and Tested.

: For practical purposes you are right. But I see a lot of people giving out info
: on SWR losses that is just plain wrong. Mostly what I hear is that if you have
: X SWR on the line then you will have Y losses. This depends on the quality of
: cable you are using and not solely on the SWR. As an example on coax the losses
: can be significant but on open wire even a 10:1 SWR will effect the losses very
: little. Just another part of the SWR picture.

Exactly. Which is why I frequently point out that SWR in an automobile
is inconsequential - as long as the transmitter will load properly.

Now, if you have 100 feet of RG-59, then it can make a difference, but
not as much as most people think - until the SWR gets really high.

Pullin' the same stunts from a mobile are no guarantee of non-detection by the FCC. With modern-day xmitter 'finger-printing' and radio-location/GPS, pin-pointing a 'high-profile' scofflaw ain't hard. In the last several years there's been several cases of mobile ham operators (regular QRM'ers) who were stopped while on the highway by Highway Patrolmen at the behest of the FCC.

The moral is.... keep a low profile! (been said before by others..)

Greetings!

Bill, we may be onto two different things...

When an amp is bypassed, the SWR should be what the radio and antenna
see as one system.

When the amp is on, this is the thingy [sic] Im' talking about...

The amps own mis-match when it's under operational conditions.

And this effect can be multiplied many times to show what appears to
be a bad SWR is really due to the impedance mis-match the amp produces
in the circuit when it's in operation.

The impedance problem at the amps own front end, can affect the
output.

As a secondary thought...

Many amps are "pre-fab'ed" with pre-set lengths and coil winds.

If a coil wind is out of alignment, or spacing of the wind in one of
the power combiners is slightly off, there is enough deviation in the
impedance "curve" the amp works in to make the combiner provide a
stable impedance output, but at a different response level.

A slight tweak of the coil spacings may do the trick thats needed in
this case...

Good luck...

Greetings!

Yes, I did. And to be honest. I don't think I can give you the info
you may need for your application.

Although, if you did put your mind to it, the radio can fit this
application very well.

As far as what is needed to accomplish the task is pretty
straightforward.

Remember my PC-122 and Grant XL mods? Applying the theory behind this
to that chassis, will easily put the radio into the catagory of such
application...and the radios own circuitry is so ... er - ahemn,
"Generic", that anyone can use it for that sole purpose. They are not
hard radios to solve, just complex.

But d*mn! good audio for such application.

Go for it.

On 10 Mar 2000 16:38:59 GMT, while the modem was pondering it's navel,

Just adding elements does not always work, the antennas at most breaks must
be roughly a quarter wave or less. And as far as the "head" is concerned...
We could give a rats ass about a "rule following kind of guy", that pays
enough attention to the newsgroup to understand what keydowns are all about.
When you have paid your entry fees then your opinion will mean something,
until then keep jerking peoples chains and adding yourself to the ever so
growing PLONK list. Your fans are dwindling. Oh yeah and don't bring up
those red shirts, you know as well as I do that,

> appreciated.

Is it a CH600 series? If it's close to this model you will find
that the door skins are fiberglass. The mirror brackets are your
only real ground plane. The roof is metal as is the main body of the
cab. If it's a standup sleeper then that is fiberglass as well.
You can run a short ground strap from the mirror brackets to the
cab hinges. That should help some. You could also put a magnet mnt.
on the roof with good results.
I installed the antenna on the rear bar on the back of the cab.
I had good results with that too. Later on I moved the antenna to
one of the grab handles just outside the door. This worked pretty
good too because the handles were bolted to the metal cab.

The amp will run fine on both of the brands mentioned. You might
just need to retune the neutralizing cap to suite the different
brands.

4052. Anyone Familiar with a Messenger 175?

Got a mobile amp, says Messenger 175, 80-15 meter on the front. Has AM/SSB, REC on/off, and Pwr on/off switches. L,M,H power knob and TX, Pwr, and REC indicators. The case is sealed by some warranty warning tape, and before I delve inside, can anyone tell me what's in this thing and if it's any good? Thanks in advance.

hi ,the higher up the frequency I go the swrs go up to about 1.7 to 1, would a antenna tuner lower the swrs enough to justify buying a tuner, the radio that I am using goes down in wattage as the swr goes up, this is around 27.850, I was thinking of getting a cheap mfj 901b tuner. thanks.......craig

I am not arguing which is divided by which. The word Ratio
in the electrical and mathmatical contex, and both has to go
hand and hand, is one unit divided by the other. Just look
up the word in the dictionary!
Cheers,
John

Good work... You have proved it's the mic! You see... that as you reduce the gain of the mic to zero... the chance for the oscillation diminishes radically. More gain... more chance to oscillate. For some reason... that mic is getting unstable when the gain is turned up. Most Astatic mics have a conducting substance sprayed on the inside of the housing shells. This spray coating is there to keep the RF away from the amplifier PC board inside. This coating must be contacted (grounded) by a small metal clip as the two mic halves are closed and screwed together. Is the clip making contact? I have seen this clip bent and not making contact causing the mic to start oscillating like crazy...

Then if you are using a different mic now that is a likely suspect. Since your problem is only on transmit... I feel that your mic may be oscillating (motorboating) due to the presence of the RF field. I would recommend that you try a a capacitor (in the 0.01uF range) from the audio wire inside the mic to ground. Does the noise change pitch when you do this?

<UNOULIKE@webtv.net> wrote in message news:21212-38C9842D-60@storefull-
My radio has a hum while in transmit mode. If i touch the back of the radio while i am transmitting the hum goes away. How can i get rid of this hum?? The microphone is wired correctly, and has really good audio otherwise. What kind of grounding solution can i resort to...since the hum does go away when i touch the back of the radio i am assuming that this is ground problem of some sort. I tried an electrolitic capacitor on the output terminals of my power supply....nothing. Any ideas??
Thanks

i think you guys ought to make it a rule that if you can't drive it on the street, then you can't enter it. this crap of going to these meets and installing these damn beam systems on these vehicles makes them nothing more and nothing less, than the proverbial base station on wheels, which to me makes this thing patently absurd. now it is a question of how many elements one can install on one's car. i think the spirit of the thing has been lost somewhere. wasn't this supposed to be a meeting of people to see who had the baddest mobile? now it is a meeting of who has the best tricked up system. heck a lot of these vehicles are not street worthy especially when they are all decked out with these beam systems. therefore if they are not street worthy then they are base stations and what does this prove; who can cheat the best? from the mind of head, head out.....

Sounds like dirt in the volume control. Spray some contact cleaner into the control to clean out the dirt. Don't mess with anything else.

In a previous article, "John Axsom" <johnnya@netins.net> writes:
>Hi, i'm new here, so i'll try to make this as short as possible. I have a

What would really be more helpful is a table of the percentage of power reflected back into the amp or radio at increments of .1 in SWR. That way you would have a better picture of where SWR really begins to affect your radio and may affect the breakdown of the finals. Just a thought. I am too lazy to figure it out and post it here.

Sounds like the transmit relay transistor that senses transmit power in SSB mode aint working. However, that is weird if it works on AM? Should be the same transistor circuit. But I don't know that amp, just the TX 667s and 1200.

Hi Pontiac

I have this radio. Did all the power and soup-up mods to it. Then I put it back to stock and use an amplifier. It works best this way. I consistently work mobile stations in European countries and out talk the -big gun bases- locally. Especially the 1W carrier swing to 20W guys.

Only Phoenix will be heating up because of the idiots who are attracting too much attention. The action seems to take place where these types are located. The heat last year was in Houston, where that ham was busted for jamming freeband frequencies for months on end, and near Lexington, KY, where a loud mouth hillbilly was taken down after exercising excessive stupidity.

Install a mod meter in line,with the stock mic on the Ranger,see where you are getting 100% mod,mine is about a little better than a third open on the radio's control,red zone on the meter is what I'm refering to, if you are using the mic for sideband keep it turned down,for am you can run it a bit higher, then experiment, meter's are cheap,but worth a lot more than a bunch of complaints,personally I have ran d-104's,rk-56,astatic636l,and a shure 450,on my 2950,the best results have been with the stock Ranger mic, and a Turner plus three.

We have started a DX Sideband Group out of Wisconsin. Called The Wisconsin Badger Sidebanders. The WBS group has a website at: http://members.tripod.com/~BadgerOutlaw/WBSclub.html

also We can be contacted by e-mail at wbsdx@hotmail.com

The group has net checkins on every Saturday at:
8:00 p.m.. to 10:00 p.m.. Central Time. on freq. 27.3750 LSB

Every Thursday 10:00 am. to 12:00 pm. on freq. 27.4850 LSB

The group was started to bring people and families together from different areas of the world to share with each other friendship and the common interest in CB and Ham Radios.

The group is FREE to join. We offer a Lifetime Membership and group # and we send out Two WBS group QSL cards to get ya started in the group. Please visit the group web site for more info. or contact us for any questions.

Happy DXing' and 73's
WBS012 TIM International Vice President & Group Sargent.

>From: "Cactus Jack" whyme@aol.com
>123 , BB has already won many trophys with a davemade, and other amps,

You're right Dennis (10-7), but he always goes with what does the most watts on spectrum. Unfortunately Dave Made doesn't any more.

> his antenna system that does it for him

Antenna systems definately play a major role.

> not your clone amps...., your
>amps do not show anymore watts than the rest of them .

Guess that's why you begged me to become part of the "MoWatts" team and leave DaveMade, and had me send you a 3pill to check it out.

>If you didnt give BB his amps for free he would still win with what he
>already has. Get Real.....

Nobody gets anything free, now do they Dennis. He may be able to win with Dave products, he just wins by a wider margin with "MoWatts" ;)

Are you certain that the impedance of the microphone matches the
requirements of the radio??

And tracking 11 m signals is a hell of a lot easier (no reflections).

That's a big 10-4! He said he wanted cheap. For a few more bucks,
you get quality. My DX-250 works day after day for over 5 years...

Actually it's not made by palomar and not for cobra,they just use the
names too help the things sell,kinda like knock offs only the real Cobra
and Palomar wouldn't deal in such things.

Very similar to a PC122 or a 640e or a TRC-465. The most likely problem
is a cold solder joint. The chassis is known for them.

No...absolutely not. The radios look very similar, but the Magnum has more power, and has variable power. In addition...the Magnum has the channel offsets for repeater use, and a heatsink around back. It also is made better, with better fit & finish and internal construction.

First off 1.7:1 isn't bad for a high,a tuner will lower things at the
rig but you won't get out any better as the reflected power will still
be there,just not all the way back to the radio.A tuner will lower
things to 1:1 but I feel this is a waste if your antenna is close to
resonant.
It is illegal for you transmit on 27.850.

I want to thank everyone that helped me with my radio. I found an open power ON/OFF. I should have been able to find this problem with a schematic. I'm looking for a part number for this switch and a location to buy it. Again thanks for all your help.

Jim
